ABSTRACT

With the booming of cyber-attacks and cyber criminals against cyber-physical systems (CPSs), discovering these attacks remains challenging. In the contemporary cyber environment, disruption surveillance represents one of the major security issues. A sizable number of methods that are constructed on machinery understanding practices have been created. Therefore, in classification to identify the infiltration, we have created the machine learning procedures. Hidden education (DL) delivers superior performance to traditional machine learning (ML) solutions. Whenever there is adequate data, DL models almost deliver excellent results. However, DL models have been slowly applied to answer the CPS cybersecurity issue contrasted among other tackles such as NLP, image processing, software vulnerability, and many more. It is also practical that many DL models have been proposed in recent publications to detect CPS cyber-attacks. A widely accepted view to explain the difficulty of detecting cyber-attacks on CPSs was accredited to the degree of complexity when superposing cybersecurity over CPSs. In this system UNSW-NB15 dataset was transferred from dataset storage place. Then, we have to implement the distinct categorization set of rules such as Logistic regression (LR) and LSTM. The experimental results shows that the accurateness for both algorithms.

ABSTRACT

Due to several relevant elements, historically, the life of stock market movement has been confusing for investors. Using deep computing in machine learning model, this work intends to drastically minimise the peril of a trend prediction. For experimental assessments, four market segments from the Stock markets in Tehran are chosen: fuel, mineral rights, diversified finance, and fundamental metals. This research contrasts nine machine learning models, with Dynamic Boosting, Random Forest, Decision Tree, extreme gradient boost, Support Vector Classifier, Naive Bayes, the k-Neighbours Logistic (KNN) Regression, and Artificial Neural Network (ANN) in addition to two effective deep learning techniques (Long Short-Term Memory and Recurrent Neural Network (RNN)) (LSTM)).

Our input values are 10 technical indicators drawn from ten years of historical data, with two possible outcomes. Initially, the signals are calculated using stock trading values as continuous data, and then they are converted to binary data for use. Considering the input methods, every forecasting model is assessed using three metrics. The assessment findings show that for continuous data, LSTM and RNN beat other prediction models significantly. Furthermore, the findings reveal that those deep learning approaches are the best in binary data evaluation; nevertheless, the difference becomes less significant since the notable gain in model execution on the second way.

ABSTRACT

In today's era of online social networking sites, there is a massive surge in the propagation of toxic content speech. They provide many betterments. However, persons with considerable differences in their viewpoints have contributed to an increase in lethality of people in internet posts and debates. With the outbreak of the pandemic, corporations, educational institutions, students, and the general public have all increased their usage in web sites. For a long time, the growing popularity of internet platforms like Twitter and Facebook has remained a major cause of anxiety. Furthermore, given the diversity of these platforms' users' histories, beliefs, race, and customs, many of them choose to use disparaging, abusive, and antagonistic language while connecting with those do not share their background. This online toxicity has been increasing exponentially by advancements provided by these social media platforms in this emerging world under the cloud of anonymity.

Social media and the internet are now fundamental components of how people disseminate and receive information. The way that individuals communicate has changed substantially over the past ten years, partly as a consequence of social media's pervasive rise. It has made it possible for a world that is more connected and informed, but it has also given the best method to a brand-new phenomenon: poisonous speech. Obtainability of an open platform for the creation, discussion, and sharing of content, some quite opportunistic people have taken part in poisonous speech and generally critical comments.

ABSTRACT

In order to create instability in the money supply and profit from the fact that our country's bank currency is the single most significant asset that our country owns, criminals circulate counterfeit notes in the financial market that appear to be identical to the real notes. These notes seem to have been copied almost exactly from the actual notes. It has been observed that there is a spike in the market circulation of counterfeit cash during times of demonetization. This has been noted to be the case. In the majority of instances, a human being will require a number of specialist features established for the purpose of identification in order to differentiate between a genuine and a counterfeit note. These elements were designed specifically for the purpose of identification. This is due to the fact that a false note will often have elements that are identical to those seen on a real note. It is possible to tell the difference between banknotes that have been issued properly and those that have been printed fraudulently, although doing so can be challenging. As a result of this, there is a requirement for a common system that can be used at automated teller machines as well as banks. It is required to develop an effective algorithm in order to construct such an automated system. This algorithm must be able to determine whether the banknote in question is legitimate bank currency or counterfeit bank cash. For the purposes of achieving the goals of constructing this system, this is absolutely necessary. This is due to the fact that in order to manufacture believable counterfeit banknotes, a significant amount of accuracy is required. In this study, we attempt to recognise real bank currency by applying six distinct supervised machine learning algorithms on a dataset that was collected from the machine learning repository at the University of California, Irvine. The purpose of this study is to improve our ability to identify authentic banknotes from counterfeit ones. In order to put this plan into action, we have relied on a variety of strategies that have proven to be effective in the past. As a continuation of our prior study, we have included an algorithm known as LightGBM and analysed its performance in comparison to the performance of other algorithms.

ABSTRACT

Similar to cloud computing, software-defined networking technology is a network management strategy that increases network performance and monitoring by enabling dynamic, programmatically efficient network design. CoFence, our proposed DDoS security system, empowers a space helps-area coordinated effort network across NFV-based space organizations. Domain networks can pool their resources with the aid of CoFence to defend against several DDoS attacks. We explicitly develop a unique asset distribution strategy for spaces that is fair, productive, and impetus viable. Maximizing a utility function based on reciprocity, the resource provider domains decide how much to give to each seeking peer. In this game, each domain has some ability to maximize its own utility. Maximizing a utility function based on reciprocity, the resource provider domains decide how much to give to each seeking peer. In contrast, the degree of demand that must be communicated to the resource supplier domains in order to obtain adequate support is determined by the resource demanding domains. The aftereffects of our reproduction show that the expected asset dispersion is compelling, impetus viable, fair, and equal. The honeypot is generally used in this undertaking to recognize gatecrashers. It distinguishes any unsafe movement did by means of the web.

ABSTRACT

Face authentication is now widely used, especially on mobile devices, rather than authentication using a personal identification number or an unlock pattern, due to its convenience. It has thus become a tempting target for attackers using a presentation attack. should be strong, Detecting Stress Using Wearables They may be challenging to nsor because of this, and remember, and should be changed regularly to ensure security. Personal identification numbers and unlock patterns are more convenient than passwords, but the user is still required to remember them, and people nearby may be able to steal a peek at them. An even more convenient method is biometric authentication, which uses a biometric trait unique to the user, eliminating the need to remember anything. This article suggests employing public-key encryption along with keyword search to effectively reduce the computing workload of biometric identification systems while maintaining privacy. Fully homo morphic encryption is used for template protection to ensure the biometric data is protected over the long term. Since they are all lattice-based, applied cryptographic algorithms also provide post-quantum security. The system maintains the unprotected system's recognition accuracy throughout. The system determines if the person is authorised or not. If the user is authorised, they are able to examine the original data; otherwise, they are unable to do so. The system uses a random forest classifier to determine whether a person is authorised or not by utilising a machine learning algorithm.

This is to certify that Ms. Bhavyashree V (USN: 1RR21MC010) from "Raja Rajeswari College of Engineering", **Bangalore**, has successfully completed her project from April 2023 to July 2023.

During project She has implement Advance Frameworks & She was very much interested to learn the functions of our core sector .

Title: "An autoencoder based malware detection approach for deep learning"

Regards,

Sainadh Panda

ACKNOWLEDGEMENT

I am overwhelmed in all humbleness and gratefulness to acknowledge my depth to all those who have helped me to put these ideas, well above the level of simplicity and into something concrete.

I take this opportunity to acknowledge the help I have received from different individuals who directly or indirectly helped in the completion of this Project Work.

I am deeply indebted to our beloved Principal, **Dr.Balakrishna R** RajaRajeswari College of Engineering for providing the necessary facilities to carry out this work.

I am extremely grateful to our beloved HoD, **Dr.T.Subburaj** Department of MCA, RRCE for nurturing our technical skills and contributing to the success of this project.

I would also express my heartfelt thanks to our Internal guide **Mrs.Deepa K R**, Assistant Professor, Department of MCA, RRCE for their continuous guidance and valuable suggestions for this Project work.

It's My Pleasure to thank Clout Business Network Ltd for providing me the best platform to complete the project work and glad to thank the external guide, Project Coordinator, Bengaluru-560078.

I also express my heartfelt thanks to all the teaching and non-teaching staff members of MCA Department for their encouragement and support throughout this work.

Bhavyashree V
(1RR21MC010)

ABSTRACT

Nowadays, when it results in malware detection, the increasing limits of classical detection approaches, additional to the improved precision of detection methods based on artificial intelligence algorithms, are shifting research findings in this area in favour of the latter. As an outcome, we present something new. A malware finding model is included in this research. This kind using model of deep learning combines a grey-scale image representation of malware with an autoencoder network, investigates achieving success the grey-scale image approach harmful software according to the autoencoder reconstruction error, and leverages dimensionality.

The reduction qualities of the auto encoder are used to distinguish malicious software from benign software. The proposed detection model obtained model of deep learning 96% and a consistent F-score of around 96% when used. We gathered an Android-side dataset that outperforms standard machine learning detection algorithms. Malware detection, autoencoders, malware pictures, and mobile application security are all available.

KEYWORDS: Autoencoder, Greyscale picture, F-score terms to create this article.

ABSTRACT

Millions of people utilise social networking sites across the world. Users interactions with social similar media websites Twitter and Facebook have a huge influence on their everyday lives, with sometimes unfavourable consequences. Majority of the social media networks have turned into a platform for scammers to disseminate a large volume of useless and harmful content. For instance, Twitter has emerged to be widely accepted all platforms time, allowing an excessive quantity with spam. Unwanted tweets are sent to consumers by phoney users in an effort to advertise services , which not only damage real users but also cause resource use to be disrupted. Furthermore, the capacity of spreading false information provided to consumers under false pretences has increased, giving to the spread of hazardous content. Detecting spammers and identifying phoney Twitter accounts has recently been a popular field of study in modern online social Networks (OSNs). In this work, we examine approaches for spotting spammers. Furthermore, a taxonomy for identifying Twitter spam methodologies is offered, which categorises the strategies in light of their capacity to detect: (i) false material, (ii) spam based on URL, (iii) spam in hot topics, and (iv) fake users.

Title: "DSAS: A Secure Data Sharing and Authorized Searchable Framework for e-Healthcare System"

Regards,

Sainadh Panda

ABSTRACT

By sharing protected private Records of health (PHRs) with physicians or institutes engaged in medical research, a growing percentage of patients in the e-healthcare system possess access to high-quality medical services. One significant problem, though, is which the encrypted PHRs make it difficult to search for information effectively, which reduces data utilization. Another problem which this and that the method e providing medical care necessitates a doctor's constant availability online, which may be too expensive for certain professionals to afford (for example, to be absent occasionally). This study develops a new, practical, secure proxy searchable re-encryption technique that enables medical service providers to do remote PHR monitoring and research in a secure and effective manner. Only authorized doctors or research institutions the ability to access patient health records (PHRs)through our system, DSAS, which ensures their privacy and confidentiality. Additionally, Alice (the doctor-in charge) can delegate medical research and use to Bob (the doctor-in-agent) or an individual research institution by means That mist server, thereby minimizing information exposure in the sky We formalize the explanation behind security and demonstrate our scheme's security. Finally, performance analysis demonstrates the effectiveness of our plan.

ABSTRACT

The aptitude to accurately count and detect humans in real-time is a valuable application in various domains, including surveillance, crowd management, and social distancing enforcement. In this project, we advocate a Python-based solution that leverages computer vision techniques to achieve live human count and detection. Our approach utilizes an amalgamate of image processing, deep learning, and object detection algorithms to accurately identify and track human bodies within a given video stream or image. To begin, we employ pre-trained deep neural networks, such as the Single Shot MultiBox Detector (SSD) or You Only Look Once (YOLO), to detect humans within the video frames. These models have undergone extensive training on large-scale datasets and are capable of detecting humans with high precision and recall. By using such models, we can rapidly identify the presence of humans in the scene. Once humans are detected, we employ advanced image processing techniques to track their movements across consecutive frames. This involves utilizing methods like bounding box tracking, optical flow, or Kalman filters to maintain a consistent and accurate count of humans within the video stream. Additionally, we can implement algorithms to estimate the direction and speed of human movement, enabling further analysis and insights. To assess the efficacy of our approach, we conducted experiments on various real-world video streams. Our results demonstrate that our system achieves reliable and efficient human counting and detection with minimal latency. We further validate the accuracy of our approach by comparing the results against ground truth annotations, and achieve a high degree of precision and recall in human identification. In conclusion, our Python-based solution provides a robust framework for live human count and detection using computer vision techniques. By leveraging state-of-the-art deep learning models and image processing algorithms, we can accurately track and identify humans in real-time video streams. This system has the potential to be deployed in a wide range of applications, contributing to improved surveillance, crowd management, and public safety measures.

Keywords:- machine learning, humans count and detect, visual intelligence.

Sainadh Panda

A large, semi-transparent watermark of the CBNL logo is centered on the page, behind the signature area.
A handwritten signature in black ink, reading 'Sainadh Panda', is written over a circular official stamp of Clout Business Network Limited. The stamp contains the company name and a central emblem.

ABSTRACT

Water is debatably one of greatest crucial periodic asset ever provided to humanity. The quality of water has a direct impact on the biological system and human well-being. Water is used for a varied choice functions, include consumption, agriculture, and modernization. Many poisons have adversely harmed aquatic excellence in the long run. Water quality forecasting and assessment are currently critical to reducing contamination of water in the future. Continuous surveillance is futile because, as expected, the liquid's excellence is assessed using pricey research facilities and measured intervals. Low quality of water necessitates a more practical and sensible solution. Using the benefits of AI methods, the suggested framework creates a model that can assess the aquatic excellence file and water quality class.

The goalmouth of this proposed framework is to offer a creative way for to assess water quality using Slope Helping Encoder. The plan includes the calculation of the Water Quality File, which is second-hand as a measure of the water's quality. The proposed method achieves high Train Accuracy (98%) and Test Exactness (94%). To classify water, the system employs numerous parameters related to water quality and features such as pH, divided oxygen, temperature, and conductivity of electricity. The model developed in this study is suitable for forecasting marine superiority as Amazing, Great, Poor, and Very Poor, and may be used for continuous monitoring and the board of water quality. The results demonstrate the adequate accuracy and precision of the suggested approach in predicting water quality, highlighting the ability of AI methods for aquatic superiority observing and the executives. The technique suggested can be rummage-saletrendy a variety of applications, including treatment of water, environmental monitoring, and marine life management.

ABSTRACT

BIRDBOOK is a unique web-based project that aims to provide an all-in-one platform for bird enthusiasts, combining an extensive encyclopedia of bird species with a social media environment. Built using the Django framework and incorporating various web development technologies, BIRDBOOK offers users a comprehensive resource to study and connect with the world of birds. The project's primary objective is to provide an interactive encyclopedia for bird species, complete with detailed descriptions and photos. Users can browse through the vast database to learn about different bird families, species, and their distinctive characteristics. Additionally, the platform encourages user contributions by allowing them to add new bird species, update existing information, and upload images, fostering a collaborative and dynamic bird knowledge hub. In extension to the encyclopedia, BIRDBOOK used as a social medium network platform tailored to the requirements of bird enthusiasts. people will have access to create their profiles and they can connect with other bird lovers, join groups, send the bird-watching experiences with others. This social component enhances community engagement and facilitates knowledge exchange among members, creating a vibrant space for bird-related discussions and interactions. Notably, BIRDBOOK goes beyond being a mere repository of information. It incorporates a feature that enables users to report bird sightings, making it a valuable tool for both avid birdwatchers and professional ornithologists. These reports contribute to a larger bird observation database, aiding in scientific research and conservation efforts.

Overall, BIRDBOOK stands as a comprehensive online platform that caters to the diverse needs of bird enthusiasts. By providing a rich encyclopedia, fostering social connections, and facilitating the sharing of bird sightings, the project promotes a deeper understanding of avian biodiversity and encourages a sense of community among individuals passionate about birds.

Project Completion Certificate

Dear sir/madam

This is to certify that Mr. Dhanush R (USN: 1RR21MC056) from "Rajarajeswari college of engineering", **Bangalore**, has successfully completed his project from April 2023 to July 2023.

During project He has implement Advance Frameworks & He was very much interested to learn the functions of our core sector .

Title: " THE ENSEMBLE TECHNIQUE IS APPLIED TO FORECASTING LIVER DISEASE"

Regards,

Sainadh Panda

A large, faint watermark of the CBNL logo is centered on the page, behind the main text.
A blue circular stamp of CBNL is positioned above a handwritten signature in black ink that reads 'Sainadh Panda'.

ACKNOWLEDGEMENT

I am overwhelmed in all humbleness and gratefulness to acknowledge my depth to all those who have helped me to put these ideas, well above the level of simplicity and into something concrete.

I take this opportunity to acknowledge the help I have received from different individuals who directly or indirectly helped in the completion of this Project Work.

I am deeply indebted to our beloved Principal, **Dr.Balakrishna R**, RajaRajeswari College of Engineering for providing the necessary facilities to carry out this work.

I am extremely grateful to our beloved HoD, **Dr.T Subburaj** Department of MCA, RRCE for nurturing our technical skills and contributing to the success of this project.

I would also express my heartfelt thanks to our Internal guide **Mr.Shreedhar K**, Assistant Professor, Department of MCA, RRCE for their continuous guidance and valuable suggestions for this Project work.

It's My Pleasure to thank Clout Business Network Ltd for providing me the best platform to complete the project work and glad to thank the external guide, Project Coordinator, Bengaluru-560078.

I also express my heartfelt thanks to all the teaching and non-teaching staff members of MCA Department for their encouragement and support throughout this work.

DHANUSH R
(1RR21MC056)

ABSTRACT

Liver illness is among these worst diseases on the planet. It occurs in the human body, most notably in the liver. The liver's primary function is to eliminate waste created by organisms, to store key vitamins required by the body to prevent them from going to waste, and to digest meals. This is a really terrible disease, and first step it must be done is to limit the risk explored by this lethal disease, and early detection can assist save the organism. The amount of people that are disease in the world is approx. 3.5 percent.

In recent decades, liver diseases have risen to prominence as among the world's top reasons for death and a condition that might be fatal. Consequently, the WHO, Chronic illnesses are liable for over 59 percent of global mortality and 46% of conditions, and they claim livings of almost 35 million people worldwide. As the liver continues to operate even when partially wounded, issues with the liver are typically not identified until it is too late. Potentially, early discovery can save a person's life. This project's need is to outline a foundation for an iterative method of finding high-risk patients' events based on a clinical study data repository cognitive ML algorithm. To provide for the prediction to be accurate, the article is also open to new difficulties and potential adjustments to other cutting-edge technology. Injury to the liver, which performs a vital function for the body, could have catastrophic repercussions. Early liver disease detection is crucial for this reason. This work attempted to predict liver disease using an ensemble technique (Gradient Boosting Classifier + AdaBoost Classifier) based on various medical information gathered from healthy blood donors and liver patients.

Completion Certificate

This is to certify that Ms Dhanushree R S (USN: 1RR21MC016) from "Rajarajeswari college of engineering" Bangalore, has successfully completed her project work from April 2023 to July 2023.

Project Title:" Real-Time Passenger Train Delay Prediction Using Machine Learning: A Case Study with Amtrak Passenger Train Routes."

We wish her all the best and success in all future endeavours.

Regards,

Raghavendra Guligare

ABSTRACT

Passenger rail snafu greatly affects passengers' determination to use rail transportation as their mode of transportation. This piece suggests real-time projection of tourist delayed trains (PTDP) models employing artificial intelligence techniques. In In this paper, the effects of employing We study Real-time based Data-frame Format (RT-DFS) and Real-time with Past based Data-frame Format (RWH-DFS) on PTPD models. The results show that MLP with RWH-DFS PTPD models did better than all other models. The impact of outside factors like ridership and previous delay characteristics at the destination, and population, night after on the real-time PTPD models, additional information about the week, location, and climate is provided. analysed and discussed. This system is, To raised precision in predicting train arrival delay time is of great significance for improving airport transportation efficiency. In our process, I must. take the input as time series dataset. After that, I must. implement the machinelearning algorithms such as logistic regression and random forest. The experimental results shows implies exactness and error values for each algorithm. The system's predictive efficiency is high. and can track the trends of multiple delay indicators well.

ABSTRACT

Those who want access to private information create unauthorised copies of official web pages and email addresses. The email will be built with actual company slogans and logos. These hackers are able to access each user's sensitive information, including financial accounts, unique login credentials, and photos, when they send links to users. The precision of the Random Forest and choice tree Equations are often used in current systems, must be improved. The currently used models have less delay. There isn't a defined user interface for existing systems. Alternative algorithms aren't in comparison to the present system. When opened, the offered emails or links take users to a phoney website that impersonates the real company. The models are employed to choose and apply the ideal machine learning model, as well as to detect fraud Urls based on URL a role factors. The strategies of artificial intelligence are used are XG Boost, Multinomial Naive Bayes , and graphical regression. The logistic regression procedure is compared to a method that performs better than the other two.

It is an ordinary technique used to deceive honest individuals into exposing the truth by using phoney websites. Hoax website addresses are designed to steal private information, such as user names, credentials, and information about online financial transactions. Phishers use sites that, both artistically and on a linguistic mirror those real websites. To prevent a rapid growth of phishing tactics on account of growing the internet, phishing protection measures must be used to recognise phishing. Data mining is a potent tool for tackling phishing attacks. Attackers often use phishing because it is easier to trick a victim onto clicking a harmful link that seems to be legitimate.

ABSTRACT

The globe is expanding daily, and with it, so are everyone's expectations. One of them is exiting to purchase a car out of all the expectations. Nevertheless, not each can provide to buy a new car every time, so they will get a used one. However, a new person is unaware of the applied automobile market pricing for his or her ideal vehicle. As the price of new cars increased due to higher technology expenses, the value argument of used cars grew stronger. Additionally, during the Covid-19 pandemic epidemic, the lack of public transportation and fear of infection force people to rely on their own means of transportation. However, the intensified pressure for manipulated cars led some car dealers to overcharge clients by putting their prices higher than usual. The need to develop a model that can forecast the charge of cast-off cars by attractive into interpretation the various characteristics and costs of other automobiles already on the market in the nation arises in command to aid consumers in understanding market trends and prices for used cars. Predicting used automobile prices is a intriguing but intriguing topic. It is tough to assessment a car's resale value. It goes without saying that a change of factors affect how much secondhand cars are worth. In command to forecast the worth of used cars based on various factors, we employed Decision Tree Regressor, a engine learning procedure, in this study. The resulting model contains more elements of used cars while also being more accurate in its predictions when competed to earlier studies.

ABSTRACT

Recent developments within machine learning played a crucial part in the healthcare industry and amongst all the significant diseases, cardiovascular illness is among the significant and most critical diseases to predict. Exists a sharp rise in the amount of cases each day. Observations prove it in every minute, 4 people between the age group of 30-50 get a stroke, so We employ machine learning techniques. to mitigate this problem. Kaggle used the utilised in this project was a dataset on heart disease. This paper demonstrates the application of several machine learning categorization techniques to predict heart disease such as Naive Bayes, Random Forest, SVM etc., and compares their accuracy scores. Later on, Stacking Ensemble Learning Technique boost our classification models' performance.

The WHO health organisation. estimates that 17.7 million people worldwide die suddenly each year due to cardiovascular conditions. The ability to people to anticipate the complexity of their health at an early stage may assist them. system for forecasting cardiac disease. A doctor's examination or a number of medical tests, such as an ECG, Stress testing, heart MRI, etc., are the traditional techniques for heart disease prediction. Exists a vast quantity of hidden information in the already-available health care data. Having access to this secret knowledge facilitates making sensible selections. For valid results, advanced computer-based data Existing systems are good at correctly forecasting the outcome, but the complexity of health markers and additional data variables lay the groundwork for future systems. evolution of novel strategies.

Certificate

Dear sir/Madam

This is to certify that Ms. Harsha M from "RajaRajeswari College of Engineering", Bangalore with (USN: 1RR21MC021) has successfully completed her project in the area of Software Development organized by Blitz Technolgy from April 2023 to July 2023.

Project Entitle :- Efficient Thyroid Disease Prediction using Features Selection and Meta- Classifiers

During the project work , She was found to be dedicated towards the tasks assigned to her.

We wish her all the best and success in all future endeavours.

With Regards

ABSTRACT

Thyroid illness, one of the most common medical diseases, can cause a variety of health problems. Thyroid dysfunction or problems affect 42 million Indians, according to recent studies. Thyroid problems, such as hypothyroidism or hyperthyroidism, are caused by thyroid hormone. TSH (Thyroid Stimulating Hormone), T3 (Triiodothyronine, T3-RIA), T4 (Thyroxine), and FTI (Free Thyroxine Index, FTI, T7) are thyroid trial mechanisms that are used to detect how thyroid hormone acts. Manually analysing these factors on vast databases to diagnose and forecast disease is time-consuming. A Decision Tree Classifier-based machine learning approach was utilized to develop a predictive model in the proposed system. According to the performance evaluation, the decision tree looks to generate superior results, with the greatest training accuracy of 100% and validation accuracy of 97%. Additionally, this findings may aid researchers in developing a solid model for identifying and categorizing hypothyroidism. Thyroid measurements, according to our findings, have a considerable effect on the clinical course of depression. Thyroid hormone testing should be pushed to standard clinical settings to detect which individuals require early or aggressive therapy to stop ongoing malfunction.

ABSTRACT

Power theft is a widespread issue that has a detrimental impact on both power customers and power businesses. It impairs utilities' capacity to grow economically, creates electromagnetic risks, and has an effect on consumers' high energy costs. The implementation of smart grids is crucial to the certification of power theft because these systems create enormous amounts of data, including information on client use, which may be used in computer training and neural nets to identify electrical theft. This research offers techniques for detecting theft that use bottomless neural nets to classify data using extensive characteristics in the temporal plus amplitude regions.

The rise of smart grids, which provide regular rewards like increased energy efficiency, fewer power interruptions, and higher security, is a result of the rising need for energy. But one of the major issues with smart grids is power theft, that's a major source of lost income for utility corporations. Therefore, one of the foremost concerns for organizations who distribute rechargeable power is electricity theft. This project's goal is to advance a real technique for detecting power theft in smart lattices that practices Reproduction Neural Grids (ANN). The suggested method would make use of data on power use that is taken from the well-known web resource kaggle. The preprocessed data will be used to feed the ANN, to train itself to recognize patterns and abnormalities in the data.

KEYWORDS: Electricity, Deep Neural Network, CNN, Artificial Neural Network.

Er. S. Lakshmanan
The Publisher

ABSTRACT

Because of several factors, including human influence, global warming, changes in the climate, forest fires or forest loss, etc., the bird species is changing dramatically nowadays. It is now feasible to monitor the bird population and their behaviour with the abet of automated bird species identification using artificial intelligence techniques. This study develops an automatic bird recognition system which requires no physical interaction because manually identifying various bird types takes a lot more time and effort. Convolutional neural networks are engaged to accomplish this goal as opposed to more conventional classifiers approximating SVM, Random Forest, and SMACPY. The keypoint is to determine the different bird species using a dataset that includes their various vocalizations. Pre-processing of the enter dataset will include building, silence elimination, rebuilding, and finally, a spectrum will be generated to serve as an input for a convolutional neural network, where CNN alterations, testing, and classification will then be performed. The output is created, the outcome is compared to pre-trained data, and birds are categorized based on their characteristics (size, color, species, etc.). It is now vital to monitor the consequences of human activity on the environment before it results in the environment suffering irreparable harm. Monitoring animal breeding behaviour, biodiversity, and population dynamics is lonetechnique to keep tabs on these consequences.

ABSTRACT

Horticulture acknowledges a crucial role in the good of everyone's quick improvement and expanded interest in food in India. It is then anticipated that the collect yield will increase. One significant factor in the low gather yield is an illness caused by organic substances, pollution, and bacteria. One of the nearly everyone imperative and fundamental tasks in the area of development is the study of plant sickness. Using plant sickness identification procedures will often impede it. It takes a grouping of skill to physically detect, screen for, and treat plant illnesses. unpaid to the enormous amount of effort and the absurd amount of planning required, representation giving out is employed to diagnose plant diseases.. Using AI estimate that obtain into story innovations like dataset construction, load photos, pre-getting ready, division, include extraction, preparation classifier, and characterization, plant sickness order should be conceivable. The chief purpose of this investigation is to fabricate a mock-up that classifies leaves into solid and unhealthy categories and forecasts plant illnesses. In this work, experts developed a model to recognize a few unique harvests and 26 illnesses from the public dataset, which includes 54,306 images of sound plant leaves and illnesses that were collected under controlled conditions. The ResNets calculation was the topic of this research. A unit of the false brain organization (ANN) is a remaining brain organization (ResNet). A leftover block from the ResNet calculation know how to be old too resolve the disappearing/exploding inclination issue. Making Leftover Organization also uses ResNet calculations. ResNets achieve a better product for the picture order.

ABSTRACT

Face authentication is now widely used, especially on mobile devices, rather than authentication using a personal identification number or an unlock pattern, due to its convenience. It has thus become a tempting target for attackers using a presentation attack. should be strong, Detecting Stress Using Wear ables They may be challenging to nsor because of this, and remember, and should be changed regularly to ensure security. Personal identification numbers and unlock patterns are more convenient than passwords, but the user is still required to remember them, and people nearby may be able to steal a peek at them. An even more convenient method is biometric authentication, which uses a biometric trait unique to the user, eliminating the need to remember anything. This article suggests employing public-key encryption along with keyword search to effectively reduce the computing workload of biometric identification systems while maintaining privacy. Fully homo morphic encryption is used for template protection to ensure the biometric data is protected over the long term. Since they are all lattice-based, applied cryptographic algorithms also provide post-quantum security. The system maintains the unprotected system's recognition accuracy throughout. The system determines if the person is authorised or not. If the user is authorised, they are able to examine the original data; otherwise, they are unable to do so. The system uses a random forest classifier to determine whether a person is authorised or not by utilising a machine learning algorithm.

ABSTRACT

In the last few years, use of social networking sites has increased tremendously. People use social media platforms to share their views on almost all subjects. These views are in various forms like, blogs, tweets, Facebook posts, online discussion boards, Instagram posts, etc. Sentiment analysis deals with the process of computationally defining and classifying the views expressed in the comment, post or document. Typically, the aim of sentiment analysis is to find out the customer's attitude towards a product or service. The proliferation of user-generated content on social media has made opinion mining an arduous job. As a microblogging platform, Twitter is being used to collect views about products, trends, and politics. The cryptocurrency market has been developed at an unprecedented speed over the past few years. Cryptocurrency works similar to standard currency, however, virtual payments are made for goods and services without the intervention of any central authority. Although cryptocurrency ensures legitimate and unique transactions by utilizing cryptographic methods, this industry is still in its inception and serious concerns have been raised about its use. Analysis of the sentiments about cryptocurrency is highly desirable to provide a holistic view of peoples' perceptions. In this regard, this study performs both sentiment analysis and emotion detection using the tweets related to the cryptocurrency which are widely used for predicting the market prices of cryptocurrency.

ABSTRACT

The complexity of a store network makes it extremely challenging to follow item wellbeing or quality worries, especially in the key farming food supply chains of individuals' everyday feasts. Numerous fundamental issues plague existing Farm alimentary networks have challenges such as data distrust amongst users and the centralised system, hard to interact as a effect of long supply chain periods, and various actors. This blockchain invention exposition successfully addresses the difficulty spot concern that occurred in the agricultural food store network identification architecture. This article describes a structure that utilises consortium and intelligent agreements for tracking and tracing the processes of farming food chains, implementing tracking and sharing across supply chains, and breaking down details as broadly as feasible in companies to remove the demand for central agencies and organisations whilst expanding purchases capture honesty and reliability, and security. as well as safety. Growers capture climatic and agrarian data on development in the Inter-Planetary File System (IPFS) and record file IPFS passwords in smart contract forms at the sametime, which not only increases data security but also mitigates the bitcoin space inflation concern. This framework was utilised by ShanweiLv fengyuan Contemporary Agricultural Investment Co.,Ltd. Despite a amount of limitations, the design has successfully incorporated elements such as separation and tracking for farming products via QR codes. As a outcome, the technique presented in this paper is critical for organisations wishing to ensure the security and quality of products accountability.

Keywords: Blockchain technology, Supply chain management, Traceability, Transparency, Efficiency.

ABSTRACT

This article discusses fraud detection and strategies to fully automate it. It has become a necessity for every bank to detect fraud. Fraud is becoming increasingly prevalent, which finishes in many damages for the banks. Transactions create unique challenges for fraud exposure due to a scarcity of short-term processing. The foremost task is a feasibility study of chosen fraud detection methods. With the aid of models, these transactions are to be tested individually and further proceeded. We first define a detection task: attributes of the dataset, the metric choice, and any techniques to control such unbalanced datasets. This leads for the reason why underlying pattern generating the dataset results: For example, cardholders may improve their purchasing habits over periods, and fraudsters may change their tactics. Later, we highlighted several methods used to obtain the sequential features of credit card relations.

The practice of obtaining financial gains by dishonest and unlawful means it is known as financial fraud. Financial fraud, which is definite as the usage of dishonest methods to obtain financial gains, has recently grown up to be a severe threat to businesses and organizations. Despite several initiatives to curtail financial scam, it continues to negatively impact society and the economy since daily losses from fraud amount to significant sums of money. Several approaches for noticing fraud were originally made available several years ago. The common of old procedures are manual, which is not only time-consuming, expensive, and inaccurate, but also unworkable. More research is being conducted, however they are ineffective at reducing losses brought on by fraud. Standard techniques for identifying these fraudulent activities, like human verifications and inspections, are inaccurate, expensive, and time-consuming.

Keywords: Fraud detection, Machine learning, Bank payment, Fraud prevention, Risk management, Transaction monitoring, Anomaly detection, Pattern recognition.

Pneumonia Detection Using Deep
Learning

Published in

SHANLAX INTERNATIONAL JOURNAL OF ARTS, SCIENCE AND HUMANITIES

Dr. N. Ayyanathan
Editor in Chief

Er. S. Lakshmanan
The Publisher

ABSTRACT

Pneumonitis is a fatal disease and this harms human respiratory system. It makes the air sacs of lungs inflammatory. It can happen due to viral or bacterial infections. It creates difficulty in breathing and causes pain. It can be severe and fatal if not treated at the earliest. So, the detection of pneumonia is needed as soon as possible. Hence Making an is the initiative's primary goal. self-learning model whose training is done on multiple digital X-rays of chest to detect the pneumonia patients. This can help in the quick diagnosis of disease and give the treatment at the earliest. The model is trained on the ResNet and finetuned to give a good accuracy and prediction. The fine-tuned model can accurately classify the disease at 91% of accuracy.

Pneumonia is a severe and a widespread virus that kills millions of people year. It is a important factor to death, claiming over four million lives annually. Early detection of pneumonia is critical for prompt and useful health service significantly enhances patient outcomes. Unfortunately, accurately diagnosing pneumonia can be challenging, especially in resource limited settings where access to trained medical professionals is limited. Long-term learning is currently capable of a potent technique for analysing medical pictures in the past decade. It offers the potential to significantly increase pneumonia detection's precision and effectiveness, perhaps potentially preventing fatalities. Large volumes of knowledge can be analysed by systems that employ deep learning quickly and accurately, allowing medical professionals to make more informed decisions.

ABSTRACT

Traditional Automated Teller Machine (ATM) systems have long relied on physical cards as the primary means of user identification and authentication. While effective to some extent, this method poses certain security risks such as card theft, unauthorized access, and inconvenience in case of card loss. To address these concerns there is growing enthusiasm for developing card-less ATM systems that utilize approaches for biometric identification such as Face and fingerprint recognition, to enhance security and convenience.

Biometric identification offers a promising solution by leveraging unique physical and behavioural characteristics of individuals. Face and fingerprint recognition are among the most used biometric methods because of their distinctiveness and simplicity capture. These techniques rely on sophisticated algorithms an deep learning how to model accurately analyse and match biometric data, enabling reliable user authentication.

Er. S. Lakshmanan
The Publisher

ABSTRACT

Today's cities must deal with the issue of sustainable transportation, and anticipating traffic conditions is crucial to reducing traffic congestion. For instance, in navigation and route planning applications, forecasting path travel time is a key problem. Additionally, the widespread adoption of information and communication technology makes vehicle data a crucial source of real-time information for applications involving intelligent transportation systems. Data about traffic congestion and the difficulty of forecasting it are accessible. The capabilities of neural network methodologies are illustrated through a comparison of deep learning techniques. LSTM (Long Short Term Memory) in resolving the issue of traffic forecasting. Various tests are suggested to not only assess the developed Machine learning (Linear regression models, but also to examine the extent to which traffic forecasting result reduce the loss value.

ABSTRACT

The motivation behind this task is to address the basic requirement for a unified stage that interfaces shelters with planned new parents. By utilizing the force of innovation, our web view application means to overcome any barrier between shelters lodging kids needing cherishing homes and people or families looking to embrace. The objectives of our web view application are twofold: to give halfway houses a stage to feature profiles and data about the kids accessible for reception, and to enable expected new parents to look, associate, and start the reception cycle in an easy to use and effective way. Through this application, we endeavour to smooth out the reception interaction, diminish obstructions, and establish a protected and strong climate for the two halfway houses and new parents. By utilizing the force of web innovations, we expect to make a stage that works with associations as well as encourages straightforwardness, trust, and ideal correspondence.

ABSTRACT

Along with to being fatal by nature, leukaemia is also very costly to treat. But early aemia discovery can save both lives and funds to those affected, particularly kids, for whom leukaemia is a common cancer type. The clarified trained machine learning model we offer in this research reliably identifies the risk of early-stage cancer using just symptoms. We additionally employ two machine learning methods, naive bayes decoder and geometric support machine, to show the power of each features on the dataset and enhance the outcomes of classifying models. Several ML models are trained on some of the data input and then tested on the related subset of data.

This procedure is called cross-validation in Cross-validation can accustomed to spot overfitting. The reliability, accuracy, recall, and the F-value were all highest for the based on results SVM method.

ABSTRACT

Given the rapid industrialization that has occurred in recent years, initiatives to safeguard the environment cannot be successfully ensured. Worryingly serious environmental difficulties that have over time grown to be the main issue harming the quality of life in the country. Therefore, in order to comprehend the potential air pollution process beforehand, we need to construct a reasonably good air quality prediction model. Conferring to the model's projected findings, it is crucial to set up and implement the appropriate controls to lessen smog. This learning makes wide usage of data mining techniques including smart optimisation algorithms, neural networks, and mutual data theory. As a training set and test set, we employ the fundamental information from open measuring locations that predicts long-term air quality. First, the association between all the monitored toxins is examined using the SOM neural network model for unsupervised grouping of pertinent pollutant data.

In many industrial and urban regions today, assessing the air quality has developed one among the most significant actions for the residents. The many types of pollution brought on by the use of power, transportation, fuel, etc. have a detrimental influence on the air quality. The accumulation of dangerous gases is seriously affecting the superiority of life in smart cities. We must implement effective air quality monitoring and prediction models that gather data on pollutant concentrations and provide assessments of local air pollution in command to covenant with the rising levels of air pollution. Particulate matter is composed of microscopic solid or liquid droplets that are so minute that breathing them in can have serious consequences on one's health. As a result, assessing and forecasting air quality has grown in significance. We will discuss the Random Forest Technique in this suggested system as a means of predicting and measuring pollution in large cities.

ABSTRACT

It is necessary to have good health to live a happy life. However, obtaining a doctor's consultation for any health issue is quite complex. Here the concept is to use the Artificial Intelligence to construct a medical chatbot or a medicalGPT that can detect the illness and provide the basic information about them before consulting a doctor. The increasing demands and complexities in the healthcare industry have sparked the development and implementation of innovative solutions to provide the facility for the patient care. One such solution is the utilization of healthcare chatbots or MedicalGPT, which influence the artificial intelligence and natural language processing techniques to connect with patients and provide them with personalized and effective healthcare services. By enabling automated conversations and providing the real-time responses, chatbots have the potential to streamline the healthcare process, alleviate the burden on healthcare professionals and improve patient satisfaction. Some of the applications of healthcare chatbots across different domains include symptom assessment and triage, medication reminders and adherence support, mental health counseling, health monitoring and feedback, appointment scheduling, and general health education.

Er. S. Lakshmanan
The Publisher

ABSTRACT

The use of short-wave radio is crucial long-distance communication medium, and Morse's signals, which prioritize clarity and effectiveness, are used in both armed forces and civilians purposes. Despite years of study, many severe challenges in real communication have always limited the performances of systems for automatic Morse detection and identification. Using deep learning, we present MorseSpectraNet, a network that can detect as well as spectrogram Morse symbol decoding. The identification and detection modules of MorseSpectraNet may collaborate to extract relevant data using shared convolutions. For identification, Morse codewords obtained from feature plans are served into a Convolutional Re-current Neural Network (CRNN), whilst signal centrelines are utilised to regress bounding boxes for detection. To complete the training, the training loss of two distinct limbs are pooled. Experimental findings on four "simulated Morse + actual background" datasets show state-of-the-art detection and identification performance, demonstrating the suggested method's usefulness in overcoming four difficulties that has long prevented its implementation. MorseSpectraNet's integrated training approach and architecture outperforms in terms of accuracy, speed, and model size, its two-stage deployment.

The Publisher

ABSTRACT

Privacy maintaining the encryption of data method is the process of encrypting dataset on big data in mobile computing. It selectively encrypts the grouping of it and its use for confidentiality under time limitations. Dynamic data selection and encrypting data required execution time. We use (D2ES)Algorithms for variable encryption of information for security of privacy. Many modern programmes forego data encryptions in order to balance security issues and a proper performance level. In this we are identifying the path when the record is transfer to the node. While transforming the file will be compressed and it sends to the receiver node. When receiving process file will be decrypted and merged and finally that will be outlet in the cloud server storage. We propose By applying necessary time to execute needs, safeguarding confidentiality is made possible.

ABSTRACT

Crop Care Suite is an advanced agricultural solution that jointly leverages the strength of machine learning, the Flask framework, and specialized modules for crop recommendation, fertilizer suggestion, and plant disease detection. This comprehensive system analyzes crucial factors such as soil type, weather conditions, historical data, crop selection, soil composition, nutrient requirements, and image processing to provide farmers with accurate and personalized insights. By leveraging state-of-the-art ML algorithms, computer vision methods, and the versatility of the Flask framework, Crop Care Suite aims to revolutionize traditional farming practices. The primary objective of Crop Care Suite is to optimize crop productivity and reduce yield losses through intelligent decision-making. By considering factors like soil type and composition, the system generates precise recommendations for suitable crops and optimal fertilizer application. This data-driven approach ensures that farmers make informed choices and maximize their harvests while minimizing resource waste. An important characteristic of Crop Care Suite is its plant illness detection module. By analyzing images of plants, the system can identify changes of diseases and provide timely alerts to farmers. This early detection enables proactive measures to be taken, avoiding the flow of diseases and minimizing crop damage. Through accurate disease diagnosis and targeted treatment recommendations, Crop Care Suite helps farmers maintain the health and vitality of their crops. The implementation of Crop Care Suite is facilitated by the Flask framework, which provides a robust and flexible foundation for building web applications. Flask allows for seamless integration of various components, enabling the smooth operation of the crop recommendation, fertilizer suggestion, and disease detection modules. Its lightweight nature and extensive documentation make Flask an ideal choice for developing user-friendly interfaces and efficient data processing pipelines. Crop Care Suite is a groundbreaking agricultural solution that harnesses the power of machine learning, the Flask framework, and advanced modules for crop recommendation, fertilizer suggestion. By considering crucial factors and providing personalized insights, this system empowers farmers to optimize their farming practices, increase crop productivity, and mitigate yield losses.

ABSTRACT

As we know the largest trouble done by cyber-attacks (e.g., Malware, Denial-of- service, phishing, inside Threats) and cyber-crimes done day-to-day in some particular Institutions, the government sector, and some organizations struggled, with the cybercrime done by some of the new organizations through cyber-attackers. they operate dark websites markets and ethical hacking attacks successfully. Cybercrime huge network troubles are arises of highly recommended network-based (e.g., Malware, phishing, Caas) cuber-crimes most of done in some business models. Some research is growing for unauthorized to access Information and guide information to the practical situation of cyber security and they improve implement applications.

Underground Economy chance to lose money and secrete banking information and financial information they attack. Might know that underground criminal business model crime-as-a-service (Caas) we have chance losses financial and banking information. Some of the group of hacking community the can be understand of the large set information and they develop the strategy and implement design and algorithm. Furthermore, it provide the practical information and how the government and organization its takes a action against cybercrime. for example in 2017 Wanna Cry 100 country for nearly 45000 attacks against the cybercrime.

Dr. N. Ayyanathan
Editor in Chief

Er. S. Lakshmanan
The Publisher

ABSTRACT

The Bug Tracking System (BTS) is an automated software application designed to track and manage reported bugs during software testing. This system, implemented using Django and Python, offers valuable benefits to employees and managers in various organizational settings. By effectively monitoring and resolving software issues, the BTS contributes to the improvement of software quality and overall reliability. The BTS incorporates anomaly detection techniques to enhance its efficiency. Anomaly detection plays a crucial role in identifying unusual patterns or behaviours within the software, enabling early detection and proactive resolution of potential bugs. This proactive approach leads to better software quality and reliability, reducing the inefficiencies caused by software errors.

The integration of user permissions and privileges within the BTS ensures that developers and testers have distinct rights when interacting with the software. This feature enhances security and control over the bug tracking process, facilitating promising association amid group of people while protecting sensitive information. In summary the Bug Tracking System (BTS) implemented using Django and Python offers a comprehensive solution for tracking and managing software bugs. With its anomaly detection capabilities and user permissions, the BTS improves software reliability and contributes to the overall enhancement of software quality in organizational settings.

ABSTRACT

First of all, Alzheimer defines the disorder as a neurologic illness that affects the brain and spine. As a result, sufferers have trouble speaking, walking, and trembling when moving. Our approach investigates how to categorise of sounds from a characteristic collection for diagnosing the disorder Parkinson's (PD). The neural networks we like to utilise in our system are from machine learning. People with PD typically include low-volume sounds with a homogenous quality. The audio characteristic dataset from the College of California, Irvine the database, as healthy as provision ramsey and XGboost classification methods, are characteristically rummage-sale in our approach. The Matthew characteristic statistic (MCC) of 89% and a height resolution of 96% produced by XGBoost allowed the algorithm to determine whether not gold sufferer is sound.

ABSTRACT

Machine learning's value has soared in diverse applications, driving automation in creative work. We present a medication suggestion engine to lighten experts' workload. Our method suggests medications effectively. COVID-19 has strained clinical resources, leading to scarcity of experts, equipment, and medications. People resort to self-medication without guidance, worsening the health situation. Bow, TF-IDF, Word2Vec, and Manual Feature are the tools we employ. for emotion prediction. By employing categorization algorithms, we analyse and select appropriate medications. Accuracy, accuracy, remembrance, f1score, and AUC score are all important metrics. evaluate predictive sentiments. Results favour LinearSVC with TF-IDF.Vectorization, works superior to every other model, with an accuracy rate of 93%.

ABSTRACT

Consequently, the exploitation of the gaps in the security of Internet of Things (IoT) devices the quantity of cyber-attacks and data breaches has significantly increased across various corporations, companies, and industries. Because it can extract and learn deep characteristics from known attacks and detect unknown attacks without the To identify cyber attacks without the requirement for manual feature engineering, machine learning has been employed. Although the machine learning (ML) a strategy has been used since Intrusion detection, the attack remains a major threat of the 13 Internet. The core idea behind this project is identifying or detecting the attacks which in occurred in the network. Now growth of social network will get increased in every day to day basis. However, The question of identifying the assaults is provoking .This project will dynamically identify the attack by analysing the information of the KDDCUP Dataset. The feature scaling method is applied and normalise the assortment of independent variables or data aspects. The feature reduction PCA algorithm is implemented and to find the directions of maximum variance in high-dimensional data and projects it onto a new subspace with equal or fewer dimensions than the original one. Finally the classification ML algorithm is applied and classify the data. The final report is generated in accordance with attacks and the normal event.

ABSTRACT

Early fault detection in power electronic systems (PESs) to maintain reliability is one of the most important issues that has been significantly addressed in recent years. In this paper, after reviewing various literature based on fault detection in PESs, data mining-based techniques including artificial neural network, machine learning, and deep learning algorithms are introduced. Then, the fault detection routine in PESs is expressed by introducing signal measurement sensors and how to extract the feature from it. Finally, based on studies, the performance of various data mining methods in detecting PESs faults is evaluated. The results of evaluations show that the deep learning-based techniques given the ability of feature extraction from measured signals are significantly more effective than other methods and as an ideal tool for future applications in power electronics industry are introduced.

ABSTRACT

The DL-based Human Assault Detector (DBHAD) is an innovative security setup that includes DL and ML methods to detect and prevent potential assaults. This advanced system incorporates features such as face expression detection, body motion tracking, and proximity alert, providing real-time monitoring and timely alerts for potential threats. By analyzing facial expressions, tracking body movements, and monitoring proximity between individuals, DBHAD enhances security measures in public spaces, workplaces, and educational institutions. The face expression detection feature of DBHAD utilizes deep learning algorithms to analyze and interpret individuals' facial expressions, enabling the system to identify suspicious behaviour and alert security personnel promptly. The body motion tracking feature employs motion sensors to track and monitor individuals' movements, effectively identifying abnormal or potentially threatening behaviour. Additionally, the proximity alert feature, powered by YOLO (You Only Look Once) technology, continuously monitors the distance between individuals, issuing alerts when people are in close proximity. DBHAD offers versatility and efficiency, surpassing single-sensor systems. With its multi-faceted framework and deep learning algorithms, it provides a comprehensive approach to threat detection. The system's customization options make it suitable for various settings, while its real-time monitoring capabilities and proactive alerts contribute to enhanced security and prevention of potential assaults.

Editor in Chief

Er. S. Lakshmanar
The Publisher

ABSTRACT

Gift of an organ transplantation systems now face a variety of requirements and obstacles in relation to registration, donor-recipient matching, organ removal, organ delivery, and transplantation, all of which are hampered by legal, clinical, ethical, and technical restrictions. The result is a comprehensive organ donation and transplantation system is essential to provide a fair and efficient procedure that improves patient experience and confidence. In this work, we present a private Ethereum block chain-based system for managing organ donation and transplantation in a completely decentralized, secure, traceable, auditable, private, and trustworthy manner. We create smart contracts and offer six algorithms, along with information on their implementation, testing, and validation. We assess the performance of the suggested solution by conducting privacy, security, and confidentiality assessments and comparing it to current solutions.

SHANLAX INTERNATIONAL JOURNAL OF ARTS, SCIENCE AND HUMANITIES

Dr. N. Ayyanathan
Editor in Chief

Er. S. Lakshmanan
The Publisher

ABSTRACT

E-Puncture is an innovative Android application designed to provide reliable and efficient puncture repair services. The application aims to assist people who encounter a punctured vehicle while traveling, particularly in unfamiliar locations, by helping them find prompt assistance and getting their vehicles repaired without hassle.

The traditional challenges faced by individuals in such situations include a lack of knowledge about nearby garages, unfamiliarity with the surrounding area, breakdowns occurring in deserted or remote locations, and the difficulty of finding a reliable and skilled mechanic to handle the repairs. E-Puncture addresses these problems by leveraging the capabilities of modern technology and mobile applications.

Using GPS technology, E-Puncture determines the user's precise location and provides a list of nearby garages. This functionality ensures that users can quickly identify and reach out to the nearest service providers. Furthermore, the application allows users to specify the nature of their breakdown or puncture issue, enabling the selected garage to appropriately assess the situation and allocate a suitable mechanic for the job.

Once the user requests assistance through the application, one of the available garages will accept the job and dispatch a mechanic to the traveller's location. This on-demand approach ensures a swift response and allows the mechanic to reach the user promptly, reducing the waiting time and inconvenience associated with traditional repair services.

The development of the E-Puncture application is facilitated by Android Studio, a powerful integrated development environment (IDE) for creating Android applications. Additionally, the application leverages the capabilities of Google Cloud Firebase, which offers a range of custom tools and libraries beneficial for the development of Android-based mobile and tablet applications. Firebase provides essential features such as a NoSQL database (Fire store), Google Maps integration for location-based services, and a rich set of graphical user interface (GUI) and user interface (UI) components.

ABSTRACT

Data changes are made using SQL, or Structured Query Language. We'll also provide you a general understanding of database structure, show you how to install MySQL safely, and offer you cutting-edge recommendations for maximizing the value of your data.

Stress is visible surface rise among all people in the modern world with all of the latest technological gadgets. So, while the wealth, individuals are not happy. Stress is the sensation of pressure. Stress can be either physical, mental, or emotional. Identification of the strain level that disrupt our socioeconomic way of life requires mechanisms for regulating stress. The World Health Organization, also known as the WHO, estimates that one in four persons have stress-related psychological problems. Stress in people leads to psychological and social problems, a loss of concentration at work, poor relationships with coworkers, despair, and in the worst cases, suicide. In order to help persons who are stressed manage their stress, counselling must be made available. While it is hard to totally eliminate stress, you can benefit from adopting precautions. Now, only specialists in medicine and physiology can analyze the mental state of somebody. Of the more popular approaches to identifying stress is a questionnaire-based method. Our project's main the aim is to use sophisticated via methods for image analysis and data mining spot indicators of stress in IT professionals. Our system is an advancement over earlier methods of stress identification, which failed to account for the feelings of the worker or live monitoring.

ABSTRACT

The computational electroencephalogram (EEG) is recently garnering significant attention in examining whether the EEG features can be utilised as fresh predictors for finding signs of modest brain injuries and the prediction of healing. In this study, an electronic method for automating DoC (Disorder of consciousness) identification by gathering data from electroencephalogram, or EEG, data is proposed. Power Spectra Density Difference (PSDD) including its recursive Cosine curve (CPSDD) is a novel related metric that is given. The subsequent processing steps.

As a result, it is crucial to devise a strategy for meticulously flagging and extracting clean EEG data to retrieve high-quality discriminative traits picking traits using PCA. The strategy then uses a team machine learning method to group brain-injured folks to DoC (positive, negative, and neutral) groups. Our suggested method for using a deep learning algorithm in high accuracy and prediction status.

ABSTRACT

since of the service's effectiveness as low-cost administration, stored in the cloud services for saving data have piqued the interest of both academia and business in recent years. Because it offers services via a distributed network, service providers must utilise safe retention and sharing mechanisms to maintain information security and consumer privacy. Cypher is the most a widely used method of avoiding the disclosure of private information hacked. However, just data encryption (for example, using AES) fails to tackle the actual necessity for managing it. Furthermore, an Proper surveillance over file requests must also be addressed so that Financial Deny of Programme (EDoS) attempts do not disrupt service delivery. We explore dual access control in this study's setting of online storage, in the sense that we build controls over both file access and download requests without sacrificing privacy or speed. In this cram, two dual authentication systems are constructed, one for every of two distinct settings. The systems' privacy and testing are also offered.

ABSTRACT

An insurance company operating as a commercial venture continues to be dealing with deception instances of various types. The sum declared by fraudulent is considerable, which may result in significant challenges; so, along with to the administration, other organisations are seeking to identify and reduce such activities. Such fraud occurred in every aspect of protection guarantee with high seriousness, for example, protection asserted towards vehicle area is deception that are frequently claimed and apparent type, which have to be possible by counterfeit mishap guarantee, as the result, we want to support a task that works on a protection guarantee informative index to identify extortion and phoney situations. The venture uses AI computations to build a model to name and characterize the guarantee. Furthermore, to focus on relative examination of The AI computations utilized in chaotic framework gathering with regards to the sensitive precision, precision, assessment, etc., . For fake exchange approval, an artificial intelligence (AI) model is built using the PySpark Python Package.

According to estimates, deception has been on increase throughout all initiatives, costing the protection area billions of dollars each year. Protection extortion is a criminal act committed with the intent of profiting financially. This is currently the most difficult issue that many insurance companies throughout the globe are dealing with. Almost all, if not every one flaw an assessment for fraudulent cases have be identified as a essential element. Protection extortion is an exploitative strategy that is frequently used for financial gain. Such deceptive cases constantly cost the security industry a large sum of money and result in billions of dollars in unnecessary costs, as result, the urge to use PC solutions to avoid extortion exercises grew, delivering clients a trustworthy and reliable environment as a result. In an addition to significantly lowering fabrication accusations.

ABSTRACT

This project presents a system that combines machine learning algorithms for disease prediction and hospital/doctor recommendation, with the aim of providing personalized suggestions to patients based on their health conditions and preferences. The system involves the collection of a comprehensive dataset comprising patient records, medical history, symptoms, laboratory results, and treatment outcomes. The data is preprocessed to handle missing values, normalize numerical features, and encode categorical variables. Feature selection and extraction techniques are then applied to identify the most informative features for disease prediction, considering factors such as age, gender, medical conditions, symptoms, and previous diagnoses. ML models, including logistic regression, decision trees, random forests, support vector machines (SVMs), or neural networks, are trained on the preprocessed data to predict the likelihood of specific diseases based on the patient's features. Concurrently, a recommendation system is developed to suggest suitable hospitals and doctors, taking into account factors such as the predicted disease, geographical location, specialty, patient reviews, and availability. The system is integrated into a user-friendly application or web portal to enable real-time data processing and prompt recommendations. Evaluation of the system is conducted using metrics like accuracy, precision, recall, and user feedback, with ongoing refinement to enhance its performance and relevance. This project aims to enhance healthcare outcomes by utilizing machine learning techniques to predict diseases and provide tailored recommendations, empowering patients to make informed healthcare decisions and enabling healthcare providers to deliver more efficient and personalized care.

KEYWORDS: ML; Disease Prediction; SVM (Support Vector Machine); Decision tree.

ABSTRACT

Using cardinal technologies cause the appearance of cyberbullying and Then use the network has become has become major source for it compared to mobile phones, platforms such as gaming and messaging. Cyberbullying can appear over multiples of ways. includes sexual remarks, threats, hate mails and posting false things about someone and this will seen and read by millions of people. Compared to traditional bullying, cyberbullying has a longer lasting effect on the victim which can affect them physically or emotionally or mentally or in all the forms. Number of suicides due to cyberbullying has increased in recent years and India is one among the four countries that has more number of cases in cyberbullying. Prevention of cyberbullying has become mandatory in universities and schools due to rising cases since 2015. This study uses robotic intelligence and deep learning to automatically identify cyberbullying comments techniques. Metrics such as reliability, vigilance, and memory and F1-score used To judge the model performance. It is with a precision of 95.47%, it was discovered that the deep learning technique known as the Gated Recurrent Unit performed better than all the other strategies examined in this essay.

social media usage systems, which is very common has led to an increase in incidents of cyberbullying, It could result in very serious mental effects and emotional effects on victims. The aim This project's The aim are to build Using deep learning, one may find instances of online bullying. online platforms posts using networks with long short-term memory (LSTM). The available research is directed towards mature languages and highlights a huge newly accepted resource poverty gap languages. This proposed system utilises Long-Short Cognition model (LSTM), a deep learning strategy for identifying and avoiding cyberbulling actions. The project consists of several modules, such as collecting information Plus information processing, model development, and evaluation.

Er. S. Lakshmanan
The Publisher

ABSTRACT

It is a difficult problem to rapidly and safely search sensitive data in cloud storage. The searchable encryption approach offers a safe way to save data without sacrificing its usefulness or confidentiality. Key-based security with recherche of keywords subfield of searchable encryption that has received a set of attention from researchers. However, the inside keyword supposition bother can be used to compromise the best part of classic PEKS methods. All new PEKS schemes will likely withstand the inside keyword guessing attack. IKGA mitigation has long proven ineffective and challenging, and the mainstream of current PEKS methods fall short of meeting their security objectives. We define the concept of Confidentiality with Dual-Server Public-Key Identification and Search Retrieval (DPAEKS), which safeguards against IKGA by utilizing two servers that do not communicate, and enables the authentication property, To be able to deal with the aforementioned issues. Next, we offer a DPAEKS architecture without bilinear pairings. Our system is really effective and offers great security, according to experimental results obtained using a real-world dataset, making it in practical applications.

Er. S. Lakshmanan
The Publisher

ABSTRACT

A clever health system that benefits both patients and physicians is a private medical record (PHR) system. A semi-trusted provider of cloud services often manages and stores PHRs in the cloud. Yet there is still a chance that untrusted people and semi-trusted parties might see confidential health information. A customer-centric PHR sharing architecture is suggested in this approach to preserve patient privacy and control over their PHRs. Before outsourcing, all PHRs in this system are secured with multi-authority attribute-based encryption. It enables very fine control of entry to PHRs and addresses the primary hosting issue. In order to guarantee data integrity on the cloud and protect the user's identity during authentication, a private login session between the cloud or the user is also suggested. The new online-offline attribute-based sign that the proposed authentication is based on is issued. It may increase patients' control over their PHRs by making the encrypted PHRs resistant to collusion attempts and preventing forgery throughout the sharing time.

ABSTRACT

ACKNOWLEDGMENT

The Internet of Things (IoT), which gives farmers access to real-time data and insights about many parts of their farms, has emerged as a game-changer in the agricultural industry. The management of water content and soil condition are two important areas where IoT-based solutions have been implemented.

We provide an overview of an Internet of Things-based intelligent agricultural system for managing water content and tracking soil condition. The system is made up of a network of sensors and actuators that are placed in agricultural fields and used to gather and transmit information on different soil factors like moisture content, pH levels, and temperature. The sensors also gather information on the weather, which includes temperature and rainfall, all of which have a significant impact on soil moisture levels.

The information gathered by the sensors is then transmitted to a central computer, where machine learning techniques are used to process and analyse it. In order to help farmers manage their crops effectively, the algorithms give them actionable knowledge regarding the state of their soil. For instance, farmers can start smart irrigation techniques to give water to the crops based on their unique demands if the data shows that the soil is too dry.

The irrigation system also uses smart technology, which sends water to the crops based on how much moisture they need. This prevents overwatering and ensures that the crops receive the appropriate amount of water for growth. It also minimises water waste.

Overall, the IoT-based intelligent farming system for monitoring soil quality and controlling water content provides farmers with an economical and effective solution to manage their crops. The system enables farmers to make knowledgeable decisions regarding crop management, resulting in improved crop yields and a more sustainable agriculture sector by delivering real-time data and insights on soil conditions.

ABSTRACT

The Internet of Things (IoT)-based smart street light utilizing a LoRa chip is a system that uses the Long Range (LoRa) wireless communication protocol and IoT technologies to increase the efficiency of street lighting. A LoRa chip is used in this system to enable communication between the street lights and a central control unit. Long-range communication is made possible by the LoRa chip with little power consumption, making it appropriate for usage outside. Our research proposed the prototypes of a Long Range (LoRa) network for agriculture application, an agriculture service platform is developed to support environmental monitoring and to improve the efficiency of agricultural management. Which focuses on low-cost and effectiveness with multi-wireless environment sensor nodes in a network. each sensors node consisting of several sensors such as a soil moisture sensor, a temperature and humidity sensor, a raindrops sensor, and a LDR sensor.

The soil moisture sensor has been designed with 4 copper sensing-rods that a longest copper rod act as a ground signal level and other copper sensing-rods using for measures moisture at each soil depth. The different levels of soil depth with respect to the ground surface. As compare to Wi-Fi module, mobile communication, Bluetooth another wireless technique a Heltec LoRa esp32 sx1276 acts as a LoRa wireless communication module for long-range environment data transfer.

The proposed network that operating with two wireless communication frequency bands, 925.2MHz for node-to-gateway communication and 2.4GHz (WLAN) for gateway-to-cloud communication. Furthermore, the proposed network with three wireless sensor nodes and a single LoRa gateway was experimental. From the experimental results, the sensor node able to environmental sensing and transfer data to the gateway. The environmental data of soil moisture under the ground surface 20cm, 40cm, and 60 cm more than 90% accuracy compared to the standard instrument. Additionally, the LoRa transceiver range is approximately 600 meters (Non-line-of-sight: NLOS) and the LoRa gateway automatically transmits environmental data to the cloud storage every 15 seconds.

ABSTRACT

There is little aid for blind assistance, Therefore, it is necessary to put into action a tool that helps them with their daily tasks. There are existing systems and software that provide visual assistance for reading and accessing a few devices, but these systems lack when the disabled person wants to do some basic tasks like identifying the surroundings in front of them such as a person or object. Therefore, very few mechanisms are invented that aid communication between the blind person and the deaf-dumb person. This project is designed to aid and help a blind person or partially impaired eyesight. This system is developed to aid blind persons without a guardian needed. The software and hardware are designed in a way that helps to detect objects, people, and gestures in vision and recognize them. This is a method that implements object detection and person recognition. For communication between deaf-dumb and blind people, we use Sign language which is detected and recognized, and the same is notified to the user. The object or sign is transmitted to a blind person in the form of audio. The idea is to make blind people's lives independent and affordable by offering them affordable solutions.

ACKNOWLEDGEMENT

We are thankful and convey sincere gratitude to the **DR. BALA KRISHANA**, Principal, Rajarajeswari College of Engineering, Bangalore.

We convey our sincere gratitude to **DR.S USHA**, Professor & Head, Department of Computer Science & Engineering, for her support and co-operation, valuable suggestion, and encouragement during the development of the project we also extend our thanks to her invaluable guidance to imbibe knowledge for the success of this project.

We convey our sincere thanks to **DR.S USHA** , Dean Research, Department of Computer Science & Engineering, for her meticulous support, continuing co-operation, valuable suggestion, and encouragement during the development of the project we also extend our thanks to her for her invaluable guidance to imbibe requisite knowledge for the success of this project.

We convey our sincere gratitude to **DR. KAMAL RAJ**, Associate Professor, Department of Computer Science & Engineering, for her meticulous support continuing co- operation, valuable suggestion and encouragement during the development of project. We also extend our thanks to her for invaluable guidance to imbibe the requisite knowledge for success of our project, as an internal guide.

We truly thank our parents who have encouraged us and supported in every stage of this project.

Last but not the least, our wishes to the entire Computer Science Department for their guidance, encouragement, inspiration and co-operation at all stages of the progress in this project without which it wouldn't have been a success.

Finally, we express our heartfelt regards to all those who helped us to complete this major project work successfully by providing support, suggestions, advice, guidance and needed encouragement.

ABSTRACT

Although achieving significant improvement on pose estimation, the major drawback is that most top-performing methods tend to adopt complex architecture and spend large computational cost to achieve higher performance.

Due to the edge device's limited resources, its top-performing methods are hard to maintain fast inference speed in practice. To address this issue, we proposed the fast and lightweight human pose estimation method to maintain high performance and bear the less computational cost.

Especially, the proposed method consists of two parts, i.e., the fast and lightweight pose network (FLPN) for pose estimation and a novel lightweight bottleneck block for reducing computational cost, which can integrate the simple network and lightweight bottleneck into an efficient method for accurate pose estimation.

In terms of lightweight bottleneck block, we introduce the structural similarity measurement (SSIM) to refine the appropriate ratio of intrinsic feature maps and reduce the model size. Furthermore, an attention mechanism is also adopted in our lightweight bottleneck block for modelling the contextual information.

We demonstrate the performance of the proposed method with extensive experiments on the two standard benchmark datasets by comparing our method with state-of-the-art methods. On the COCO keypoint detection dataset, our proposed method attains a similar accuracy with these state-of-the-art methods, but the computational cost of these top-performing methods is more than 7 times that of ours.

ACKNOWLEDGEMENT

Any achievement, be it scholastic or otherwise does not depend solely on the individual efforts but on the guidance, encouragement and cooperation of intellectuals, elders and friends. A number of personalities, in their own capacities have helped me in carrying out this project. I would like to take this opportunity to thank them all.

I wish to express my profound gratitude to **Dr. A.C Shanmugam**, R.R.C.E, Bengaluru for his moral support towards completion of my internship.

I wish to express my profound gratitude to **Dr. R Balakrishna**, Principal, R.R.C.E, Bengaluru for his moral support towards completion of my internship.

I would like to express my deepest gratitude to **Dr. S Usha** , Head of Department, Computer Science and Engineering, R.R.C.E, Bengaluru, for his continuous support and encouragement.

I would like to acknowledge the unbridled enthusiasm of my guide **Mrs. Hemavathi J**, Assistant Professor, Department of Computer Science and Engineering, R.R.C.E, Bengaluru, for his encouragement and valuable guidance throughout my internship.

I thank my Parents, and all the teaching and non-teaching faculty members of Department of Computer Science and Engineering for their constant support and encouragement.

ABSTRACT

According to the WHO, 1.35 million people die in traffic accidents each year. Technology is improving every year, which has made it possible to integrate artificial intelligence even into cars. Significant development has occurred in recent years in creating lane detection algorithms that can precisely identify and track lane markings in vast variety of driving situations, including low light and bad weather. The deployment of self-driving vehicles based on ADAS technology has been carefully examined. Autonomous Vehicles are another name for the Self-Driving Cars. This vehicle has the capacity to perceive its surroundings. The various components in the car will operate according to these processed sensed characteristics without the need for a human operator. An autonomous vehicle functions similarly to a regular vehicle but has no human driver. The software section that makes up autonomous vehicles is essential. Between Hardware Components and Applications, the Software Architecture serves as a link. Self-Driving Cars include two vital components. These automatic functions, which operate without human intervention, are Lane Detection and Traffic Signal Detection. In this paper, a machine learning algorithm is proposed. This algorithm is mostly used to create shape algorithms to assist in lane detection and traffic sign detection by detecting shapes and lane. Both of these applications were developed in Python utilizing the OpenCV2, NumPy libraries, and CNN algorithm for Edge detection. Overall, lane detection is an important technology for the creation of ADAS and self driving applications. Ongoing research aims to increase the precision and robustness of these systems to guarantee their safety and dependability in actual driving situations.

Keywords: - Self-Driving, ADAS System, CNN, OpenCV, Lane Detection.

ACKNOWLEDGEMENT

Any achievement, be it scholastic or otherwise does not depend solely on individual efforts but on the guidance, encouragement, and cooperation of intellectuals, elders, and friends. A number of personalities, in their own capacities, have helped us in carrying out this work. We would like to take this opportunity to thank them all.

We wish to express our profound gratitude to **Dr. A.C Shanmugam**, Chairman, R.R.C.E, Bengaluru for his moral support towards the completion of Our Project.

We wish to express our profound gratitude to **Dr. R Balakrishna**, Principal, R.R.C.E, Bengaluru for his moral support towards the completion of Our Project.

We would like to express our deepest gratitude to **Dr. Usha Sakthivel**, Head of Department, Computer Science and Engineering, R.R.C.E, Bengaluru, for her continuous support and encouragement.

We would like to acknowledge the unbridled enthusiasm of our Project guide **Dr. Kirubha D**, Associate Professor, Department of Computer Science and Engineering, R.R.C.E, Bengaluru, for her encouragement and valuable guidance throughout Our Project.

We thank our Parents, and all the teaching and non-teaching faculty members of the Department of Computer Science and Engineering for their constant support and encouragement. Last, but not least, We would like to thank our friends who provided us with valuable suggestions for our work during the Project.

ABSTRACT

The objective of this project is to develop an IoT-based pothole detection system that helps in identifying and alerting road users about the presence of potholes on the road. The system is designed using NodeMCU, an ultrasonic sensor, a GSM module, and a GPS module, which are integrated to detect potholes, capture the location of the potholes, and alert the user.

The system works by using the ultrasonic sensor to detect the presence of a pothole. When a pothole is detected, the GPS module captures the location of the pothole, and the GSM module sends a message to the user's phone, alerting them about the pothole's presence and providing the location information. This information can help road users to avoid the pothole and reduce the risk of accidents.

This system is an innovative solution to the problem of potholes on roads. By alerting road users about the presence of potholes, the system helps to improve road safety, reduce accidents, and save lives. The system is also cost-effective and can be easily implemented on existing roads without the need for significant modifications.

This project focuses on the development of an IoT-based pothole detection system that provides an efficient and effective solution for detecting potholes and alerting road users. The proposed system is expected to contribute significantly to road safety and help reduce accidents caused by potholes.

DECLARATION

I, **A RAJKUMAR** (USN:1RR21MC001), students of 4th Semester, Department of MCA, Rajarajeswari College Of Engineering, Bengaluru-74, declare that the project entitled “**Deep Learning-Based Digital Physical System Threat Identification A Study of Information security**” is a record of the original work done by me under the guidance and supervision of **Mrs.DEEPA K R**, Assistant Professor, Department of MCA, RRCE and this project work has not formed the basis of any Degree/Diploma/Fellowship or similar title to any candidate of any university.

Name: A RAJ KUMAR
USN: 1RR21MC001

Signature of the candidate

ABSTRACT

With the booming of cyber-attacks and cyber criminals against cyber-physical systems (CPSs), discovering these attacks remains challenging. In the contemporary cyber environment, disruption surveillance represents one of the major security issues. A sizable number of methods that are constructed on machinery understanding practices have been created. Therefore, in classification to identify the infiltration, we have created the machine learning procedures. Hidden education (DL) delivers superior performance to traditional machine learning (ML) solutions. Whenever there is adequate data, DL models almost deliver excellent results. However, DL models have been slowly applied to answer the CPS cybersecurity issue contrasted among other tackles such as NLP, image processing, software vulnerability, and many more. It is also practical that many DL models have been proposed in recent publications to detect CPS cyber-attacks. A widely accepted view to explain the difficulty of detecting cyber-attacks on CPSs was accredited to the degree of complexity when superposing cybersecurity over CPSs. In this system UNSW-NB15 dataset was transferred from dataset storage place. Then, we have to implement the distinct categorization set of rules such as Logistic regression (LR) and LSTM. The experimental results shows that the accurateness for both algorithms.

ABSTRACT

Due to several relevant elements, historically, the life of stock market movement has been confusing for investors. Using deep computing in machine learning model, this work intends to drastically minimise the peril of a trend prediction. For experimental assessments, four market segments from the Stock markets in Tehran are chosen: fuel, mineral rights, diversified finance, and fundamental metals. This research contrasts nine machine learning models, with Dynamic Boosting, Random Forest, Decision Tree, extreme gradient boost, Support Vector Classifier, Naive Bayes, the k-Neighbours Logistic (KNN) Regression, and Artificial Neural Network (ANN) in addition to two effective deep learning techniques (Long Short-Term Memory and Recurrent Neural Network (RNN)) (LSTM)).

Our input values are 10 technical indicators drawn from ten years of historical data, with two possible outcomes. Initially, the signals are calculated using stock trading values as continuous data, and then they are converted to binary data for earlier use. Considering the input methods, every forecasting model is assessed using three metrics. The assessment findings show that for continuous data, LSTM and RNN beat other prediction models significantly. Furthermore, the findings reveal that those deep learning approaches are the best in binary data evaluation; nevertheless, the difference becomes less significant since the notable gain in model execution on the second way.

ABSTRACT

In today's era of online social networking sites, there is a massive surge in the propagation of toxic content speech. They provide many betterments. However, persons with considerable differences in their viewpoints have contributed to an increase in lethality of people in internet posts and debates. With the outbreak of the pandemic, corporations, educational institutions, students, and the general public have all increased their usage in web sites. For a long time, the growing popularity of internet platforms like Twitter and Facebook has remained a major cause of anxiety. Furthermore, given the diversity of these platforms' users' histories, beliefs, race, and customs, many of them choose to use disparaging, abusive, and antagonistic language while connecting with those do not share their background. This online toxicity has been increasing exponentially by advancements provided by these social media platforms in this emerging world under the cloud of anonymity.

Social media and the internet are now fundamental components of how people disseminate and receive information. The way that individuals communicate has changed substantially over the past ten years, partly as a consequence of social media's pervasive rise. It has made it possible for a world that is more connected and informed, but it has also given the best method to a brand-new phenomenon: poisonous speech. Obtainability of an open platform for the creation, discussion, and sharing of content, some quite opportunistic people have taken part in poisonous speech and generally critical comments.

ABSTRACT

In order to create instability in the money supply and profit from the fact that our country's bank currency is the single most significant asset that our country owns, criminals circulate counterfeit notes in the financial market that appear to be identical to the real notes. These notes seem to have been copied almost exactly from the actual notes. It has been observed that there is a spike in the market circulation of counterfeit cash during times of demonetization. This has been noted to be the case. In the majority of instances, a human being will require a number of specialist features established for the purpose of identification in order to differentiate between a genuine and a counterfeit note. These elements were designed specifically for the purpose of identification. This is due to the fact that a false note will often have elements that are identical to those seen on a real note. It is possible to tell the difference between banknotes that have been issued properly and those that have been printed fraudulently, although doing so can be challenging. As a result of this, there is a requirement for a common system that can be used at automated teller machines as well as banks. It is required to develop an effective algorithm in order to construct such an automated system. This algorithm must be able to determine whether the banknote in question is legitimate bank currency or counterfeit bank cash. For the purposes of achieving the goals of constructing this system, this is absolutely necessary. This is due to the fact that in order to manufacture believable counterfeit banknotes, a significant amount of accuracy is required. In this study, we attempt to recognise real bank currency by applying six distinct supervised machine learning algorithms on a dataset that was collected from the machine learning repository at the University of California, Irvine. The purpose of this study is to improve our ability to identify authentic banknotes from counterfeit ones. In order to put this plan into action, we have relied on a variety of strategies that have proven to be effective in the past. As a continuation of our prior study, we have included an algorithm known as LightGBM and analysed its performance in comparison to the performance of other algorithms.

ABSTRACT

Similar to cloud computing, software-defined networking technology is a network management strategy that increases network performance and monitoring by enabling dynamic, programmatically efficient network design. CoFence, our proposed DDoS security system, empowers a space helps-area coordinated effort network across NFV-based space organizations. Domain networks can pool their resources with the aid of CoFence to defend against several DDoS attacks. We explicitly develop a unique asset distribution strategy for spaces that is fair, productive, and impetus viable. Maximizing a utility function based on reciprocity, the resource provider domains decide how much to give to each seeking peer. In this game, each domain has some ability to maximize its own utility. Maximizing a utility function based on reciprocity, the resource provider domains decide how much to give to each seeking peer. In contrast, the degree of demand that must be communicated to the resource supplier domains in order to obtain adequate support is determined by the resource demanding domains. The aftereffects of our reproduction show that the expected asset dispersion is compelling, impetus viable, fair, and equal. The honeypot is generally used in this undertaking to recognize gatecrashers. It distinguishes any unsafe movement did by means of the web.

ABSTRACT

Face authentication is now widely used, especially on mobile devices, rather than authentication using a personal identification number or an unlock pattern, due to its convenience. It has thus become a tempting target for attackers using a presentation attack. should be strong, Detecting Stress Using Wearables They may be challenging to nsor because of this, and remember, and should be changed regularly to ensure security. Personal identification numbers and unlock patterns are more convenient than passwords, but the user is still required to remember them, and people nearby may be able to steal a peek at them. An even more convenient method is biometric authentication, which uses a biometric trait unique to the user, eliminating the need to remember anything. This article suggests employing public-key encryption along with keyword search to effectively reduce the computing workload of biometric identification systems while maintaining privacy. Fully homo morphic encryption is used for template protection to ensure the biometric data is protected over the long term. Since they are all lattice-based, applied cryptographic algorithms also provide post-quantum security. The system maintains the unprotected system's recognition accuracy throughout. The system determines if the person is authorised or not. If the user is authorised, they are able to examine the original data; otherwise, they are unable to do so. The system uses a random forest classifier to determine whether a person is authorised or not by utilising a machine learning algorithm.

Dear sir/madam

This is to certify that Ms. Bhavyashree V (USN: 1RR21MC010) from "Raja Rajeswari College of Engineering", **Bangalore**, has successfully completed her project from April 2023 to July 2023.

During project She has implement Advance Frameworks & She was very much interested to learn the functions of our core sector .

Title: "An autoencoder based malware detection approach for deep learning"

Regards,

Sainadh Panda

ACKNOWLEDGEMENT

I am overwhelmed in all humbleness and gratefulness to acknowledge my depth to all those who have helped me to put these ideas, well above the level of simplicity and into something concrete.

I take this opportunity to acknowledge the help I have received from different individuals who directly or indirectly helped in the completion of this Project Work.

I am deeply indebted to our beloved Principal, **Dr.Balakrishna R** RajaRajeswari College of Engineering for providing the necessary facilities to carry out this work.

I am extremely grateful to our beloved HoD, **Dr.T.Subburaj** Department of MCA, RRCE for nurturing our technical skills and contributing to the success of this project.

I would also express my heartfelt thanks to our Internal guide **Mrs.Deepa K R**, Assistant Professor, Department of MCA, RRCE for their continuous guidance and valuable suggestions for this Project work.

It's My Pleasure to thank Clout Business Network Ltd for providing me the best platform to complete the project work and glad to thank the external guide, Project Coordinator, Bengaluru-560078.

I also express my heartfelt thanks to all the teaching and non-teaching staff members of MCA Department for their encouragement and support throughout this work.

Bhavyashree V
(1RR21MC010)

ABSTRACT

Nowadays, when it results in malware detection, the increasing limits of classical detection approaches, additional to the improved precision of detection methods based on artificial intelligence algorithms, are shifting research findings in this area in favour of the latter. As an outcome, we present something new. A malware finding model is included in this research. This kind using model of deep learning combines a grey-scale image representation of malware with an autoencoder network, investigates achieving success the grey-scale image approach harmful software according to the autoencoder reconstruction error, and leverages dimensionality.

The reduction qualities of the auto encoder are used to distinguish malicious software from benign software. The proposed detection model obtained model of deep learning 96% and a consistent F-score of around 96% when used. We gathered an Android-side dataset that outperforms standard machine learning detection algorithms. Malware detection, autoencoders, malware pictures, and mobile application security are all available.

KEYWORDS: Autoencoder, Greyscale picture, F-score terms to create this article.

ABSTRACT

Millions of people utilise social networking sites across the world. Users interactions with social similar media websites Twitter and Facebook have a huge influence on their everyday lives, with sometimes unfavourable consequences. Majority of the social media networks have turned into a platform for scammers to disseminate a large volume of useless and harmful content. For instance, Twitter has emerged to be widely accepted all platforms time, allowing an excessive quantity with spam. Unwanted tweets are sent to consumers by phoney users in an effort to advertise services , which not only damage real users but also cause resource use to be disrupted. Furthermore, the capacity of spreading false information provided to consumers under false pretences has increased, giving to the spread of hazardous content. Detecting spammers and identifying phoney Twitter accounts has recently been a popular field of study in modern online social Networks (OSNs). In this work, we examine approaches for spotting spammers. Furthermore, a taxonomy for identifying Twitter spam methodologies is offered, which categorises the strategies in light of their capacity to detect: (i) false material, (ii) spam based on URL, (iii) spam in hot topics, and (iv) fake users.

Project Completion Certificate

Dear sir/madam

This is to certify that Ms. CHANDAN K (USN: 1RR21MC011) from "Raja Rajeswari College of Engineering", **Bangalore**, has successfully completed his project from April 2023 to July 2023.

During project He has implement Advance Frameworks & He was very much interested to learn the functions of our core sector .

Title: "DSAS: A Secure Data Sharing and Authorized Searchable Framework for e-Healthcare System"

Regards,

Sainadh Panda

ABSTRACT

By sharing protected private Records of health (PHRs) with physicians or institutes engaged in medical research, a growing percentage of patients in the e-healthcare system possess access to high-quality medical services. One significant problem, though, is which the encrypted PHRs make it difficult to search for information effectively, which reduces data utilization. Another problem which this and that the method e providing medical care necessitates a doctor's constant availability online, which may be too expensive for certain professionals to afford (for example, to be absent occasionally). This study develops a new, practical, secure proxy searchable re-encryption technique that enables medical service providers to do remote PHR monitoring and research in a secure and effective manner. Only authorized doctors or research institutions the ability to access patient health records (PHRs)through our system, DSAS, which ensures their privacy and confidentiality. Additionally, Alice (the doctor-in charge) can delegate medical research and use to Bob (the doctor-in-agent) or an individual research institution by means That mist server, thereby minimizing information exposure in the sky We formalize the explanation behind security and demonstrate our scheme's security. Finally, performance analysis demonstrates the effectiveness of our plan.

ACKNOWLEDGEMENT

I am over helmed in all humbleness and gratefulness to acknowledge my depth to all those who have helped me to put these ideas, well above the level of simplicity and into something concrete.

I take this opportunity to acknowledge the help I have received from different individuals who directly or indirectly helped in completion of this **Project Work**.

I am deeply indebted to our beloved our Principal, **Dr. R. Balakrishna**, Rajarajeswari College Of Engineering for providing the necessary facilities to carry out this work.

I am extremely grateful to our beloved HOD, **Dr. T Subburaj**, Associate Professor and HOD, Department of MCA, RRCE for nurturing our technical skills and contributing to the success of this project.

I would also express my heartfelt thanks to our Internal guide **Dr. T Subburaj** Associate Professor and HOD, Department of MCA, RRCE for their continuous guidance and valuable suggestions for this Project work.

It's my pleasure to thank **RRCE** for providing me the best platform to complete the project work and glad to thank the external guide **Dr. S Usha**, Dean, Department of R&D, Bangalore-560074

I also express my heartfelt thanks to all the teaching and nonteaching staff members of MCA Department for their encouragement and support throughout this work.

CHANDANA N L
1RR21MC013

ABSTRACT

The aptitude to accurately count and detect humans in real-time is a valuable application in various domains, including surveillance, crowd management, and social distancing enforcement. In this project, we advocate a Python-based solution that leverages computer vision techniques to achieve live human count and detection. Our approach utilizes an amalgamate of image processing, deep learning, and object detection algorithms to accurately identify and track human bodies within a given video stream or image. To begin, we employ pre-trained deep neural networks, such as the Single Shot MultiBox Detector (SSD) or You Only Look Once (YOLO), to detect humans within the video frames. These models have undergone extensive training on large-scale datasets and are capable of detecting humans with high precision and recall. By using such models, we can rapidly identify the presence of humans in the scene. Once humans are detected, we employ advanced image processing techniques to track their movements across consecutive frames. This involves utilizing methods like bounding box tracking, optical flow, or Kalman filters to maintain a consistent and accurate count of humans within the video stream. Additionally, we can implement algorithms to estimate the direction and speed of human movement, enabling further analysis and insights. To assess the efficacy of our approach, we conducted experiments on various real-world video streams. Our results demonstrate that our system achieves reliable and efficient human counting and detection with minimal latency. We further validate the accuracy of our approach by comparing the results against ground truth annotations, and achieve a high degree of precision and recall in human identification. In conclusion, our Python-based solution provides a robust framework for live human count and detection using computer vision techniques. By leveraging state-of-the-art deep learning models and image processing algorithms, we can accurately track and identify humans in real-time video streams. This system has the potential to be deployed in a wide range of applications, contributing to improved surveillance, crowd management, and public safety measures.

Keywords:- machine learning, humans count and detect, visual intelligence.

ABSTRACT

Water is debatably one of greatest crucial periodic asset ever provided to humanity. The quality of water has a direct impact on the biological system and human well-being. Water is used for a varied choice functions, include consumption, agriculture, and modernization. Many poisons have adversely harmed aquatic excellence in the long run. Water quality forecasting and assessment are currently critical to reducing contamination of water in the future. Continuous surveillance is futile because, as expected, the liquid's excellence is assessed using pricey research facilities and measured intervals. Low quality of water necessitates a more practical and sensible solution. Using the benefits of AI methods, the suggested framework creates a model that can assess the aquatic excellence file and water quality class.

The goalmouth of this proposed framework is to offer a creative way for to assess water quality using Slope Helping Encoder. The plan includes the calculation of the Water Quality File, which is second-hand as a measure of the water's quality. The proposed method achieves high Train Accuracy (98%) and Test Exactness (94%). To classify water, the system employs numerous parameters related to water quality and features such as pH, divided oxygen, temperature, and conductivity of electricity. The model developed in this study is suitable for forecasting marinesuperiority as Amazing, Great, Poor, and Very Poor, and may be used for continuous monitoring and the board of water quality. The results demonstrate the adequate accuracy and precision of the suggested approach in predicting water quality, highlighting the ability of AI methods for aquaticsuperiority observing and the executives. The technique suggested can be rummage-saletrendy a variety of applications, including treatment of water, environmental monitoring, and marine life management.

ABSTRACT

BIRDBOOK is a unique web-based project that aims to provide an all-in-one platform for bird enthusiasts, combining an extensive encyclopedia of bird species with a social media environment. Built using the Django framework and incorporating various web development technologies, BIRDBOOK offers users a comprehensive resource to study and connect with the world of birds. The project's primary objective is to provide an interactive encyclopedia for bird species, complete with detailed descriptions and photos. Users can browse through the vast database to learn about different bird families, species, and their distinctive characteristics. Additionally, the platform encourages user contributions by allowing them to add new bird species, update existing information, and upload images, fostering a collaborative and dynamic bird knowledge hub. In extension to the encyclopedia, BIRDBOOK used as a social medium network platform tailored to the requirements of bird enthusiasts. people will have access to create their profiles and they can connect with other bird lovers, join groups, send the bird-watching experiences with others. This social component enhances community engagement and facilitates knowledge exchange among members, creating a vibrant space for bird-related discussions and interactions. Notably, BIRDBOOK goes beyond being a mere repository of information. It incorporates a feature that enables users to report bird sightings, making it a valuable tool for both avid birdwatchers and professional ornithologists. These reports contribute to a larger bird observation database, aiding in scientific research and conservation efforts.

Overall, BIRDBOOK stands as a comprehensive online platform that caters to the diverse needs of bird enthusiasts. By providing a rich encyclopedia, fostering social connections, and facilitating the sharing of bird sightings, the project promotes a deeper understanding of avian biodiversity and encourages a sense of community among individuals passionate about birds.

DHANUSH R
(1RR21MC056)

ABSTRACT

Liver illness is among these worst diseases on the planet. It occurs in the human body, most notably in the liver. The liver's primary function is to eliminate waste created by organisms, to store key vitamins required by the body to prevent them from go to waste, and to digest meals. This is a really terrible disease, and first step it must be done is to limit the risk explored by this lethal disease, and early detection can assist save the organism. The amount of people that are disease in the world is approx. 3.5 percent.

In recent decades, liver diseases have risen to prominence as among the world's top reasons for death and a condition that might fatal. Consequently, the WHO, Chronic illnesses are liable for over 59 percent of global mortality and 46% of conditions, and they claim livings of almost 35 million people worldwide. As the liver continues to operate even when partially wounded, issues with the liver are typically not identified until it is too late. Potentially, early discovery can save a person's life. This project's need is to outline a foundation for an iterative method of finding high-risk patients' events based on a clinical study data repository cognitive ML algorithm. To provide for the prediction to be accurate, the article is also open to new difficulties and potential adjustments to other cutting-edge technology. Injury to the liver, which performs a vital function for the body, could have catastrophic repercussions. Early liver disease detection is crucial for this reason. This work attempted to predict liver disease using an ensemble technique (Gradient Boosting Classifier + AdaBoost Classifier) based on various medical information gathered from healthy blood donors and liver patients.

Completion Certificate

This is to certify that Ms Dhanushree R S (USN: 1RR21MC016) from "Rajarajeswari college of engineering" Bangalore, has successfully completed her project work from April 2023 to July 2023.

Project Title:" Real-Time Passenger Train Delay Prediction Using Machine Learning: A Case Study with Amtrak Passenger Train Routes."

We wish her all the best and success in all future endeavours.

Regards,

Raghavendra Guligare

ABSTRACT

Passenger rail snafu greatly affects passengers' determination to use rail transportation as their mode of transportation. This piece suggests real-time projection of tourist delayed trains (PTDP) models employing artificial intelligence techniques. In this paper, the effects of employing We study Real-time based Data-frame Format (RT-DFS) and Real-time with Past based Data-frame Format (RWH-DFS) on PTPD models. The results show that MLP with RWH-DFS PTPD models did better than all other models. The impact of outside factors like ridership and previous delay characteristics at the destination, and population, night after on the real-time PTPD models, additional information about the week, location, and climate is provided. analysed and discussed. This system is, To raised precision in predicting train arrival delay time is of great significance for improving airport transportation efficiency. In our process, I must. take the input as time series dataset. After that, I must. implement the machinelearning algorithms such as logistic regression and random forest. The experimental results shows implies exactness and error values for each algorithm. The system's predictive efficiency is high. and can track the trends of multiple delay indicators well.

Certification

This is to certify that Ms. Diana Jennifer. S (USN : 1RR21MC017) undergoing MCA from "RajaRajeswari College Of Engineering", Bangalore, has successfully completed her project at our company as per curricular requirements from April 2023 to July 2023.

Title : "Detection of phishing websites using machine learning"

She has been found hardworking to the best of our knowledge and satisfaction during her tenure over here.

We wish her all the best for future growth!!!!!!!!!!!!!!!!!!!!

With Regards,

Mohammed Ilyas

ABSTRACT

Those who want access to private information create unauthorised copies of official web pages and email addresses. The email will be built with actual company slogans and logos. These hackers are able to access each user's sensitive information, including financial accounts, unique login credentials, and photos, when they send links to users. The precision of the Random Forest and choice tree Equations are often used in current systems, must be improved. The currently used models have less delay. There isn't a defined user interface for existing systems. Alternative algorithms aren't in comparison to the present system. When opened, the offered emails or links take users to a phoney website that impersonates the real company. The models are employed to choose and apply the ideal machine learning model, as well as to detect fraud Urls based on URL a role factors. The strategies of artificial intelligence are used are XG Boost, Multinomial Naive Bayes , and graphical regression. The logistic regression procedure is compared to a method that performs better than the other two.

It is an ordinary technique used to deceive honest individuals into exposing the truth by using phoney websites. Hoax website addresses are designed to steal private information, such as user names, credentials, and information about online financial transactions. Phishers use sites that, both artistically and on a linguistic mirror those real websites. To prevent a rapid growth of phishing tactics on account of growing the internet, phishing protection measures must be used to recognise phishing. Data mining is a potent tool for tackling phishing attacks. Attackers often use phishing because it is easier to trick a victim onto clicking a harmful link that seems to be legitimate.

ABSTRACT

The globe is expanding daily, and with it, so are everyone's expectations. One of them is exiting to purchase a car out of all the expectations. Nevertheless, not each can provide to buy a new car every time, so they will get a used one. However, a new person is unaware of the applied automobile market pricing for his or her ideal vehicle. As the price of new cars increased due to higher technology expenses, the value argument of used cars grew stronger. Additionally, during the Covid-19 pandemic epidemic, the lack of public transportation and fear of infection force people to rely on their own means of transportation. However, the intensified pressure for manipulated cars led some car dealers to overcharge clients by putting their prices higher than usual. The need to develop a model that can forecast the charge of cast-off cars by attractive into interpretation the various characteristics and costs of other automobiles already on the market in the nation arises in command to aid consumers in understanding market trends and prices for used cars. Predicting used automobile prices is a intriguing but intriguing topic. It is tough to assessment a car's resale value. It goes without saying that a change of factors affect how much secondhand cars are worth. In command to forecast the worth of used cars based on various factors, we employed Decision Tree Regressor, a engine learning procedure, in this study. The resulting model contains more elements of used cars while also being more accurate in its predictions when competed to earlier studies.

ABSTRACT

Thyroid illness, one of the most common medical diseases, can cause a variety of health problems. Thyroid dysfunction or problems affect 42 million Indians, according to recent studies. Thyroid problems, such as hypothyroidism or hyperthyroidism, are caused by thyroid hormone. TSH (Thyroid Stimulating Hormone), T3 (Triiodothyronine, T3-RIA), T4 (Thyroxine), and FTI (Free Thyroxine Index, FTI, T7) are thyroid trial mechanisms that are used to detect how thyroid hormone acts. Manually analysing these factors on vast databases to diagnose and forecast disease is time-consuming. A Decision Tree Classifier-based machine learning approach was utilized to develop a predictive model in the proposed system. According to the performance evaluation, the decision tree looks to generate superior results, with the greatest training accuracy of 100% and validation accuracy of 97%. Additionally, this findings may aid researchers in developing a solid model for identifying and categorizing hypothyroidism. Thyroid measurements, according to our findings, have a considerable effect on the clinical course of depression. Thyroid hormone testing should be pushed to standard clinical settings to detect which individuals require early or aggressive therapy to stop ongoing malfunction.

ABSTRACT

Power theft is a widespread issue that has a detrimental impact on both power customers and power businesses. It impairs utilities' capacity to grow economically, creates electromagnetic risks, and has an effect on consumers' high energy costs. The implementation of smart grids is crucial to the certification of power theft because these systems create enormous amounts of data, including information on client use, which may be used in computer training and neural nets to identify electrical theft. This research offers techniques for detecting theft that use bottomless neural nets to classify data using extensive characteristics in the temporal plus amplitude regions.

The rise of smart grids, which provide regular rewards like increased energy efficiency, fewer power interruptions, and higher security, is a result of the rising need for energy. But one of the major issues with smart grids is power theft, that's a major source of lost income for utility corporations. Therefore, one of the foremost concerns for organizations who distribute rechargeable power is electricity theft. This project's goal is to advance a real technique for detecting power theft in smart lattices that practices Reproduction Neural Grids (ANN). The suggested method would make use of data on power use that is taken from the well-known web resource kaggle. The preprocessed data will be used to feed the ANN, to train itself to recognize patterns and abnormalities in the data.

Er. S. Lakshmanan
The Publisher

ABSTRACT

Because of several factors, including human influence, global warming, changes in the climate, forest fires or forest loss, etc., the bird species is changing dramatically nowadays. It is now feasible to monitor the bird population and their behaviour with the abet of automated bird species identification using artificial intelligence techniques. This study develops an automatic bird recognition system which requires no physical interaction because manually identifying various bird types takes a lot more time and effort. Convolutional neural networks are engaged to accomplish this goal as opposed to more conventional classifiers approximating SVM, Random Forest, and SMACPY. The keypoint is to determine the different bird species using a dataset that includes their various vocalizations. Pre-processing of the enter dataset will include building, silence elimination, rebuilding, and finally, a spectrum will be generated to serve as an input for a convolutional neural network, where CNN alterations, testing, and classification will then be performed. The output is created, the outcome is compared to pre-trained data, and birds are categorized based on their characteristics (size, color, species, etc.). It is now vital to monitor the consequences of human activity on the environment before it results in the environment suffering irreparable harm. Monitoring animal breeding behaviour, biodiversity, and population dynamics is lonetechnique to keep tabs on these consequences.

ABSTRACT

Horticulture acknowledges a crucial role in the good of everyone's quick improvement and expanded interest in food in India. It is then anticipated that the collect yield will increase. One significant factor in the low gather yield is an illness caused by organic substances, pollution, and bacteria. One of the nearly everyone imperative and fundamental tasks in the area of development is the study of plant sickness. Using plant sickness identification procedures will often impede it. It takes a grouping of skill to physically detect, screen for, and treat plant illnesses. unpaid to the enormous amount of effort and the absurd amount of planning required, representation giving out is employed to diagnose plant diseases.. Using AI estimate that obtain into story innovations like dataset construction, load photos, pre-getting ready, division, include extraction, preparation classifier, and characterization, plant sickness order should be conceivable. The chief purpose of this investigation is to fabricate a mock-up that classifies leaves into solid and unhealthy categories and forecasts plant illnesses. In this work, experts developed a model to recognize a few unique harvests and 26 illnesses from the public dataset, which includes 54,306 images of sound plant leaves and illnesses that were collected under controlled conditions. The ResNets calculation was the topic of this research. A unit of the false brain organization (ANN) is a remaining brain organization (ResNet). A leftover block from the ResNet calculation know how to be old too resolve the disappearing/exploding inclination issue. Making Leftover Organization also uses ResNet calculations. ResNets achieve a better product for the picture order.

ABSTRACT

Face authentication is now widely used, especially on mobile devices, rather than authentication using a personal identification number or an unlock pattern, due to its convenience. It has thus become a tempting target for attackers using a presentation attack. should be strong, Detecting Stress Using Wear ables They may be challenging to nsor because of this, and remember, and should be changed regularly to ensure security. Personal identification numbers and unlock patterns are more convenient than passwords, but the user is still required to remember them, and people nearby may be able to steal a peek at them. An even more convenient method is biometric authentication, which uses a biometric trait unique to the user, eliminating the need to remember anything. This article suggests employing public-key encryption along with keyword search to effectively reduce the computing workload of biometric identification systems while maintaining privacy. Fully homo morphic encryption is used for template protection to ensure the biometric data is protected over the long term. Since they are all lattice-based, applied cryptographic algorithms also provide post-quantum security. The system maintains the unprotected system's recognition accuracy throughout. The system determines if the person is authorised or not. If the user is authorised, they are able to examine the original data; otherwise, they are unable to do so. The system uses a random forest classifier to determine whether a person is authorised or not by utilising a machine learning algorithm.

ABSTRACT

In the last few years, use of social networking sites has increased tremendously. People use social media platforms to share their views on almost all subjects. These views are in various forms like, blogs, tweets, Facebook posts, online discussion boards, Instagram posts, etc. Sentiment analysis deals with the process of computationally defining and classifying the views expressed in the comment, post or document. Typically, the aim of sentiment analysis is to find out the customer's attitude towards a product or service. The proliferation of user-generated content on social media has made opinion mining an arduous job. As a microblogging platform, Twitter is being used to collect views about products, trends, and politics. The cryptocurrency market has been developed at an unprecedented speed over the past few years. Cryptocurrency works similar to standard currency, however, virtual payments are made for goods and services without the intervention of any central authority. Although cryptocurrency ensures legitimate and unique transactions by utilizing cryptographic methods, this industry is still in its inception and serious concerns have been raised about its use. Analysis of the sentiments about cryptocurrency is highly desirable to provide a holistic view of peoples' perceptions. In this regard, this study performs both sentiment analysis and emotion detection using the tweets related to the cryptocurrency which are widely used for predicting the market prices of cryptocurrency.

ABSTRACT

The complexity of a store network makes it extremely challenging to follow item wellbeing or quality worries, especially in the key farming food supply chains of individuals' everyday feasts. Numerous fundamental issues plague existing Farm alimentary networks have challenges such as data distrust amongst users and the centralised system, hard to interact as a effect of long supply chain periods, and various actors. This blockchain invention exposition successfully addresses the difficulty spot concern that occurred in the agricultural food store network identification architecture. This article describes a structure that utilises consortium and intelligent agreements for tracking and tracing the processes of farming food chains, implementing tracking and sharing across supply chains, and breaking down details as broadly as feasible in companies to remove the demand for central agencies and organisations whilst expanding purchases capture honesty and reliability, and security. as well as safety. Growers capture climatic and agrarian data on development in the Inter-Planetary File System (IPFS) and record file IPFS passwords in smart contract forms at the sametime, which not only increases data security but also mitigates the bitcoin space inflation concern. This framework was utilised by ShanweiLv fengyuan Contemporary Agricultural Investment Co., Ltd. Despite a amount of limitations, the design has successfully incorporated elements such as separation and tracking for farming products via QR codes. As a outcome, the technique presented in this paper is critical for organisations wishing to ensure the security and quality of products accountability.

ABSTRACT

This article discusses fraud detection and strategies to fully automate it. It has become a necessity for every bank to detect fraud. Fraud is becoming increasingly prevalent, which finishes in many damages for the banks. Transactions create unique challenges for fraud exposure due to a scarcity of short-term processing. The foremost task is a feasibility study of chosen fraud detection methods. With the aid of models, these transactions are to be tested individually and further proceeded. We first define a detection task: attributes of the dataset, the metric choice, and any techniques to control such unbalanced datasets. This leads for the reason why underlying pattern generating the dataset results: For example, cardholders may improve their purchasing habits over periods, and fraudsters may change their tactics. Later, we highlighted several methods used to obtain the sequential features of credit card relations.

The practice of obtaining financial gains by dishonest and unlawful means it is known as financial fraud. Financial fraud, which is definite as the usage of dishonest methods to obtain financial gains, has recently grown up to be a severe threat to businesses and organizations. Despite several initiatives to curtail financial scam, it continues to negatively impact society and the economy since daily losses from fraud amount to significant sums of money. Several approaches for noticing fraud were originally made available several years ago. The common of old procedures are manual, which is not only time-consuming, expensive, and inaccurate, but also unworkable. More research is being conducted, however they are ineffective at reducing losses brought on by fraud. Standard techniques for identifying these fraudulent activities, like human verifications and inspections, are inaccurate, expensive, and time-consuming.

Keywords: Fraud detection, Machine learning, Bank payment, Fraud prevention, Risk management, Transaction monitoring, Anomaly detection, Pattern recognition.

Pneumonia Detection Using Deep
Learning

Published in

SHANLAX INTERNATIONAL JOURNAL OF ARTS, SCIENCE AND HUMANITIES

Dr. N. Ayyanathan
Editor in Chief

Er. S. Lakshmanan
The Publisher

ABSTRACT

Pneumonitis is a fatal disease and this harms human respiratory system. It makes the air sacs of lungs inflammatory. It can happen due to viral or bacterial infections. It creates difficulty in breathing and causes pain. It can be severe and fatal if not treated at the earliest. So, the detection of pneumonia is needed as soon as possible. Hence Making an is the initiative's primary goal. self-learning model whose training is done on multiple digital X-rays of chest to detect the pneumonia patients. This can help in the quick diagnosis of disease and give the treatment at the earliest. The model is trained on the ResNet and finetuned to give a good accuracy and prediction. The fine-tuned model can accurately classify the disease at 91% of accuracy.

Pneumonia is a severe and a widespread virus that kills millions of people year. It is a important factor to death, claiming over four million lives annually. Early detection of pneumonia is critical for prompt and useful health service significantly enhances patient outcomes. Unfortunately, accurately diagnosing pneumonia can be challenging, especially in resource limited settings where access to trained medical professionals is limited. Long-term learning is currently capable of a potent technique for analysing medical pictures in the past decade. It offers the potential to significantly increase pneumonia detection's precision and effectiveness, perhaps potentially preventing fatalities. Large volumes of knowledge can be analysed by systems that employ deep learning quickly and accurately, allowing medical professionals to make more informed decisions.

ABSTRACT

Traditional Automated Teller Machine (ATM) systems have long relied on physical cards as the primary means of user identification and authentication. While effective to some extent, this method poses certain security risks such as card theft, unauthorized access, and inconvenience in case of card loss. To address these concerns there is growing enthusiasm for developing card-less ATM systems that utilize approaches for biometric identification such as Face and fingerprint recognition, to enhance security and convenience.

Biometric identification offers a promising solution by leveraging unique physical and behavioural characteristics of individuals. Face and fingerprint recognition are among the most used biometric methods because of their distinctiveness and simplicity capture. These techniques rely on sophisticated algorithms an deep learning how to model accurately analyse and match biometric data, enabling reliable user authentication.

ABSTRACT

Today's cities must deal with the issue of sustainable transportation, and anticipating traffic conditions is crucial to reducing traffic congestion. For instance, in navigation and route planning applications, forecasting path travel time is a key problem. Additionally, the widespread adoption of information and communication technology makes vehicle data a crucial source of real-time information for applications involving intelligent transportation systems. Data about traffic congestion and the difficulty of forecasting it are accessible. The capabilities of neural network methodologies are illustrated through a comparison of deep learning techniques. LSTM (Long Short Term Memory) in resolving the issue of traffic forecasting. Various tests are suggested to not only assess the developed Machine learning (Linear regression models, but also to examine the extent to which traffic forecasting result reduce the loss value.

ABSTRACT

The motivation behind this task is to address the basic requirement for a unified stage that interfaces shelters with planned new parents. By utilizing the force of innovation, our web view application means to overcome any barrier between shelters lodging kids needing cherishing homes and people or families looking to embrace. The objectives of our web view application are twofold: to give halfway houses a stage to feature profiles and data about the kids accessible for reception, and to enable expected new parents to look, associate, and start the reception cycle in an easy to use and effective way. Through this application, we endeavour to smooth out the reception interaction, diminish obstructions, and establish a protected and strong climate for the two halfway houses and new parents. By utilizing the force of web innovations, we expect to make a stage that works with associations as well as encourages straightforwardness, trust, and ideal correspondence.

ABSTRACT

Along with to being fatal by nature, leukaemia is also very costly to treat. But early aemia discovery can save both lives and funds to those affected, particularly kids, for whom leukaemia is a common cancer type. The clarified trained machine learning model we offer in this research reliably identifies the risk of early-stage cancer using just symptoms. We additionally employ two machine learning methods, naive bayes decoder and geometric support machine, to show the power of each features on the dataset and enhance the outcomes of classifying models. Several ML models are trained on some of the data input and then tested on the related subset of data.

This procedure is called cross-validation in Cross-validation can accustomed to spot overfitting. The reliability, accuracy, recall, and the F-value were all highest for the based on results SVM method.

Er. S. Lakshmanan
The Publisher

ABSTRACT

Given the rapid industrialization that has occurred in recent years, initiatives to safeguard the environment cannot be successfully ensured. Worryingly serious environmental difficulties that have over time grown to be the main issue harming the quality of life in the country. Therefore, in order to comprehend the potential air pollution process beforehand, we need to construct a reasonably good air quality prediction model. Conferring to the model's projected findings, it is crucial to set up and implement the appropriate controls to lessen smog. This learning makes wide usage of data mining techniques including smart optimisation algorithms, neural networks, and mutual data theory. As a training set and test set, we employ the fundamental information from open measuring locations that predicts long-term air quality. First, the association between all the monitored toxins is examined using the SOM neural network model for unsupervised grouping of pertinent pollutant data.

In many industrial and urban regions today, assessing the air quality has developed one among the most significant actions for the residents. The many types of pollution brought on by the use of power, transportation, fuel, etc. have a detrimental influence on the air quality. The accumulation of dangerous gases is seriously affecting the superiority of life in smart cities. We must implement effective air quality monitoring and prediction models that gather data on pollutant concentrations and provide assessments of local air pollution in command to covenant with the rising levels of air pollution. Particulate matter is composed of microscopic solid or liquid droplets that are so minute that breathing them in can have serious consequences on one's health. As a result, assessing and forecasting air quality has grown in significance. We will discuss the Random Forest Technique in this suggested system as a means of predicting and measuring pollution in large cities.

ABSTRACT

It is necessary to have good health to live a happy life. However, obtaining a doctor's consultation for any health issue is quite complex. Here the concept is to use the Artificial Intelligence to construct a medical chatbot or a medicalGPT that can detect the illness and provide the basic information about them before consulting a doctor. The increasing demands and complexities in the healthcare industry have sparked the development and implementation of innovative solutions to provide the facility for the patient care. One such solution is the utilization of healthcare chatbots or MedicalGPT, which influence the artificial intelligence and natural language processing techniques to connect with patients and provide them with personalized and effective healthcare services. By enabling automated conversations and providing the real-time responses, chatbots have the potential to streamline the healthcare process, alleviate the burden on healthcare professionals and improve patient satisfaction. Some of the applications of healthcare chatbots across different domains include symptom assessment and triage, medication reminders and adherence support, mental health counseling, health monitoring and feedback, appointment scheduling, and general health education.

The Publisher

ABSTRACT

The use of short-wave radio is crucial long-distance communication medium, and Morse's signals, which prioritize clarity and effectiveness, are used in both armed forces and civilians purposes. Despite years of study, many severe challenges in real communication have always limited the performances of systems for automatic Morse detection and identification. Using deep learning, we present MorseSpectraNet, a network that can detect as well as spectrogram Morse symbol decoding. The identification and detection modules of MorseSpectraNet may collaborate to extract relevant data using shared convolutions. For identification, Morse codewords obtained from feature plans are served into a Convolutional Re-current Neural Network (CRNN), whilst signal centrelines are utilised to regress bounding boxes for detection. To complete the training, the training loss of two distinct limbs are pooled. Experimental findings on four "simulated Morse + actual background" datasets show stateofthe-art detection and identification performance, demonstrating the suggested method's usefulness in overcoming four difficulties that has long prevented its implementation. MorseSpectraNet's integrated training approach and architecture outperforms in terms of accuracy, speed, and model size, its two-stage deployment.

Dr. N. Ayyanathan
Editor in Chief

Er. S. Lakshmanan
The Publisher

ABSTRACT

Privacy maintaining the encryption of data method is the process of encrypting dataset on big data in mobile computing. It selectively encrypts the grouping of it and its use for confidentiality under time limitations. Dynamic data selection and encrypting data required execution time. We use (D2ES)Algorithms for variable encryption of information for security of privacy. Many modern programmes forego data encryptions in order to balance security issues and a proper performance level. In this we are identifying the path when the record is transfer to the node. While transforming the file will be compressed and it sends to the receiver node. When receiving process file will be decrypted and merged and finally that will be outlet in the cloud server storage. We propose By applying necessary time to execute needs, safeguarding confidentiality is made possible.

ABSTRACT

Crop Care Suite is an advanced agricultural solution that jointly leverages machine learning, the Flask framework, and specialized modules for crop recommendation, fertilizer suggestion, and plant disease detection. This comprehensive system analyzes crucial factors such as soil type, weather conditions, historical data, crop selection, soil composition, nutrient requirements, and image processing to provide farmers with accurate and personalized insights. By leveraging state-of-the-art ML algorithms, computer vision methods, and the versatility of the Flask framework, Crop Care Suite aims to revolutionize traditional farming practices. The primary objective of Crop Care Suite is to optimize crop productivity and reduce yield losses through intelligent decision-making. By considering factors like soil type and composition, the system generates precise recommendations for suitable crops and optimal fertilizer application. This data-driven approach ensures that farmers make informed choices and maximize their harvests while minimizing resource waste. An important characteristic of Crop Care Suite is its plant illness detection module. By analyzing images of plants, the system can identify changes of diseases and provide timely alerts to farmers. This early detection enables proactive measures to be taken, avoiding the flow of diseases and minimizing crop damage. Through accurate disease diagnosis and targeted treatment recommendations, Crop Care Suite helps farmers maintain the health and vitality of their crops. The implementation of Crop Care Suite is facilitated by the Flask framework, which provides a robust and flexible foundation for building web applications. Flask allows for seamless integration of various components, enabling the smooth operation of the crop recommendation, fertilizer suggestion, and disease detection modules. Its lightweight nature and extensive documentation make Flask an ideal choice for developing user-friendly interfaces and efficient data processing pipelines. Crop Care Suite is a groundbreaking agricultural solution that harnesses the power of machine learning, the Flask framework, and advanced modules for crop recommendation, fertilizer suggestion. By considering crucial factors and providing personalized insights, this system empowers farmers to optimize their farming practices, increase crop productivity, and mitigate yield losses.

ABSTRACT

As we know the largest trouble done by cyber-attacks (e.g., Malware, Denial-of- service, phishing, inside Threats) and cyber-crimes done day-to-day in some particular Institutions, the government sector, and some organizations struggled, with the cybercrime done by some of the new organizations through cyber-attackers. they operate dark websites markets and ethical hacking attacks successfully. Cybercrime huge network troubles are arises of highly recommended network-based (e.g., Malware, phishing, Caas) cuber-crimes most of done in some business models. Some research is growing for unauthorized to access Information and guide information to the practical situation of cyber security and they improve implement applications.

Underground Economy chance to lose money and secrete banking information and financial information they attack. Might know that underground criminal business model crime-as-a-service (Caas) we have chance losses financial and banking information. Some of the group of hacking community the can be understand of the large set information and they develop the strategy and implement design and algorithm. Furthermore, it provide the practical information and how the government and organization its takes a action against cybercrime. for example in 2017 Wanna Cry 100 country for nearly 45000 attacks against the cybercrime.

Bug Tracking for Improving Software
Reliability Using Django

Published in

SHANLAX INTERNATIONAL JOURNAL OF ARTS, SCIENCE AND HUMANITIES

Dr. N. Ayyanathan
Editor in Chief

Er. S. Lakshmanan
The Publisher

ABSTRACT

The Bug Tracking System (BTS) is an automated software application designed to track and manage reported bugs during software testing. This system, implemented using Django and Python, offers valuable benefits to employees and managers in various organizational settings. By effectively monitoring and resolving software issues, the BTS contributes to the improvement of software quality and overall reliability. The BTS incorporates anomaly detection techniques to enhance its efficiency. Anomaly detection plays a crucial role in identifying unusual patterns or behaviours within the software, enabling early detection and proactive resolution of potential bugs. This proactive approach leads to better software quality and reliability, reducing the inefficiencies caused by software errors.

The integration of user permissions and privileges within the BTS ensures that developers and testers have distinct rights when interacting with the software. This feature enhances security and control over the bug tracking process, facilitating promising association amid group of people while protecting sensitive information. In summary the Bug Tracking System (BTS) implemented using Django and Python offers a comprehensive solution for tracking and managing software bugs. With its anomaly detection capabilities and user permissions, the BTS improves software reliability and contributes to the overall enhancement of software quality in organizational settings.

ABSTRACT

First of all, Alzheimer defines the disorder as a neurologic illness that affects the brain and spine. As a result, sufferers have trouble speaking, walking, and trembling when moving. Our approach investigates how to categorise of sounds from a characteristic collection for diagnosing the disorder Parkinson's (PD). The neural networks we like to utilise in our system are from machine learning. People with PD typically include low-volume sounds with a homogenous quality. The audio characteristic dataset from the College of California, Irvine the database, as healthy as provision ramsey and XGboost classification methods, are characteristically rummage-sale in our approach. The Matthew characteristic statistic (MCC) of 89% and a height resolution of 96% produced by XGBoost allowed the algorithm to determine whether not gold sufferer is sound.

ABSTRACT

Machine learning's value has soared in diverse applications, driving automation in creative work. We present a medication suggestion engine to lighten experts' workload. Our method suggests medications effectively. COVID-19 has strained clinical resources, leading to scarcity of experts, equipment, and medications. People resort to self-medication without guidance, worsening the health situation. Bow, TF-IDF, Word2Vec, and Manual Feature are the tools we employ. for emotion prediction. By employing categorization algorithms, we analyse and select appropriate medications. Accuracy, accuracy, remembrance, f1score, and AUC score are all important metrics. evaluate predictive sentiments. Results favour LinearSVC with TF-IDF.Vectorization, works superior to every other model, with an accuracy rate of 93%.

ABSTRACT

Consequently, the exploitation of the gaps in the security of Internet of Things (IoT) devices the quantity of cyber-attacks and data breaches has significantly increased across various corporations, companies, and industries. Because it can extract and learn deep characteristics from known attacks and detect unknown attacks without the To identify cyber attacks without the requirement for manual feature engineering, machine learning has been employed. Although the machine learning (ML) a strategy has been used since Intrusion detection, the attack remains a major threat of the 13 Internet. The core idea behind this project is identifying or detecting the attacks which in occurred in the network. Now growth of social network will get increased in every day to day basis. However, The question of identifying the assaults is provoking .This project will dynamically identify the attack by analysing the information of the KDDCUP Dataset. The feature scaling method is applied and normalise the assortment of independent variables or data aspects. The feature reduction PCA algorithm is implemented and to find the directions of maximum variance in high-dimensional data and projects it onto a new subspace with equal or fewer dimensions than the original one. Finally the classification ML algorithm is applied and classify the data. The final report is generated in accordance with attacks and the normal event.

KEYWORDS:DDOS, Machine learning, Cyber Attacks,PCA Algorithm.

ABSTRACT

Early fault detection in power electronic systems (PESs) to maintain reliability is one of the most important issues that has been significantly addressed in recent years. In this paper, after reviewing various literature based on fault detection in PESs, data mining-based techniques including artificial neural network, machine learning, and deep learning algorithms are introduced. Then, the fault detection routine in PESs is expressed by introducing signal measurement sensors and how to extract the feature from it. Finally, based on studies, the performance of various data mining methods in detecting PESs faults is evaluated. The results of evaluations show that the deep learning-based techniques given the ability of feature extraction from measured signals are significantly more effective than other methods and as an ideal tool for future applications in power electronics industry are introduced.

Editor in Chief

Er. S. Lakshmanan
The Publisher

ABSTRACT

The DL-based Human Assault Detector (DBHAD) is an innovative security setup that includes DL and ML methods to detect and prevent potential assaults. This advanced system incorporates features such as face expression detection, body motion tracking, and proximity alert, providing real-time monitoring and timely alerts for potential threats. By analyzing facial expressions, tracking body movements, and monitoring proximity between individuals, DBHAD enhances security measures in public spaces, workplaces, and educational institutions. The face expression detection feature of DBHAD utilizes deep learning algorithms to analyze and interpret individuals' facial expressions, enabling the system to identify suspicious behaviour and alert security personnel promptly. The body motion tracking feature employs motion sensors to track and monitor individuals' movements, effectively identifying abnormal or potentially threatening behaviour. Additionally, the proximity alert feature, powered by YOLO (You Only Look Once) technology, continuously monitors the distance between individuals, issuing alerts when people are in close proximity. DBHAD offers versatility and efficiency, surpassing single-sensor systems. With its multi-faceted framework and deep learning algorithms, it provides a comprehensive approach to threat detection. The system's customization options make it suitable for various settings, while its real-time monitoring capabilities and proactive alerts contribute to enhanced security and prevention of potential assaults.

Management of Organ Donation and
Transplantation using Block Chain

Published in

SHANLAX INTERNATIONAL JOURNAL OF ARTS, SCIENCE AND HUMANITIES

Dr. N. Ayyanathan
Editor in Chief

Er. S. Lakshmanar
The Publisher

ABSTRACT

Gift of an organ transplantation systems now face a variety of requirements and obstacles in relation to registration, donor-recipient matching, organ removal, organ delivery, and transplantation, all of which are hampered by legal, clinical, ethical, and technical restrictions. The result is a comprehensive organ donation and transplantation system is essential to provide a fair and efficient procedure that improves patient experience and confidence. In this work, we present a private Ethereum block chain-based system for managing organ donation and transplantation in a completely decentralized, secure, traceable, auditable, private, and trustworthy manner. We create smart contracts and offer six algorithms, along with information on their implementation, testing, and validation. We assess the performance of the suggested solution by conducting privacy, security, and confidentiality assessments and comparing it to current solutions.

In recognition of the Publication of the Paper Entitled
E - Puncture

Published in

SHANLAX INTERNATIONAL JOURNAL OF ARTS, SCIENCE AND HUMANITIES

Dr. N. Ayyanathan
Editor in Chief

Er. S. Lakshmanan
The Publisher

ABSTRACT

E-Puncture is an innovative Android application designed to provide reliable and efficient puncture repair services. The application aims to assist people who encounter a punctured vehicle while traveling, particularly in unfamiliar locations, by helping them find prompt assistance and getting their vehicles repaired without hassle.

The traditional challenges faced by individuals in such situations include a lack of knowledge about nearby garages, unfamiliarity with the surrounding area, breakdowns occurring in deserted or remote locations, and the difficulty of finding a reliable and skilled mechanic to handle the repairs. E-Puncture addresses these problems by leveraging the capabilities of modern technology and mobile applications.

Using GPS technology, E-Puncture determines the user's precise location and provides a list of nearby garages. This functionality ensures that users can quickly identify and reach out to the nearest service providers. Furthermore, the application allows users to specify the nature of their breakdown or puncture issue, enabling the selected garage to appropriately assess the situation and allocate a suitable mechanic for the job.

Once the user requests assistance through the application, one of the available garages will accept the job and dispatch a mechanic to the traveller's location. This on-demand approach ensures a swift response and allows the mechanic to reach the user promptly, reducing the waiting time and inconvenience associated with traditional repair services.

The development of the E-Puncture application is facilitated by Android Studio, a powerful integrated development environment (IDE) for creating Android applications. Additionally, the application leverages the capabilities of Google Cloud Firebase, which offers a range of custom tools and libraries beneficial for the development of Android-based mobile and tablet applications. Firebase provides essential features such as a NoSQL database (Fire store), Google Maps integration for location-based services, and a rich set of graphical user interface (GUI) and user interface (UI) components.

ABSTRACT

Data changes are made using SQL, or Structured Query Language. We'll also provide you a general understanding of database structure, show you how to install MySQL safely, and offer you cutting-edge recommendations for maximizing the value of your data.

Stress is visible surface rise among all people in the modern world with all of the latest technological gadgets. So, while the wealth, individuals are not happy. Stress is the sensation of pressure. Stress can be either physical, mental, or emotional. Identification of the strain level that disrupt our socioeconomic way of life requires mechanisms for regulating stress. The World Health Organization, also known as the WHO, estimates that one in four persons have stress-related psychological problems. Stress in people leads to psychological and social problems, a loss of concentration at work, poor relationships with coworkers, despair, and in the worst cases, suicide. In order to help persons who are stressed manage their stress, counselling must be made available. While it is hard to totally eliminate stress, you can benefit from adopting precautions. Now, only specialists in medicine and physiology can analyze the mental state of somebody. Of the more popular approaches to identifying stress is a questionnaire-based method. Our project's main the aim is to use sophisticated via methods for image analysis and data mining spot indicators of stress in IT professionals. Our system is an advancement over earlier methods of stress identification, which failed to account for the feelings of the worker or live monitoring.

ABSTRACT

The computational electroencephalogram (EEG) is recently garnering significant attention in examining whether the EEG features can be utilised as fresh predictors for finding signs of modest brain injuries and the prediction of healing. In this study, an electronic method for automating DoC (Disorder of consciousness) identification by gathering data from electroencephalogram, or EEG, data is proposed. Power Spectra Density Difference (PSDD) including its recursive Cosine curve (CPSDD) is a novel related metric that is given. The subsequent processing steps.

As a result, it is crucial to devise a strategy for meticulously flagging and extracting clean EEG data to retrieve high-quality discriminative traits picking traits using PCA. The strategy then uses a team machine learning method to group brain-injured folks to DoC (positive, negative, and neutral) groups. Our suggested method for using a deep learning algorithm in high accuracy and prediction status.

Certificate

Dear sir/Madam

This is to certify that Mr. Vidyasagar from "Rajarajeshwari College of engineering", Bangalore with (USN: 1RR21MCO51) has successfully completed his project in the area of Software Development organized by Blitz Technolgoy from April 2023 to July 2023.

Project Entitle :- **Dual Access Control for Cloud Based Data Storage and Sharing**

During the project work , He was found to be dedicated towards the tasks assigned to him.

We wish him all the best and success in all future endeavours.

ABSTRACT

since of the service's effectiveness as low-cost administration, stored in the cloud services for saving data have piqued the interest of both academia and business in recent years. Because it offers services via a distributed network, service providers must utilise safe retention and sharing mechanisms to maintain information security and consumer privacy. Cypher is the most a widely used method of avoiding the disclosure of private information hacked. However, just data encryption (for example, using AES) fails to tackle the actual necessity for managing it. Furthermore, an Proper surveillance over file requests must also be addressed so that Financial Deny of Programme (EDoS) attempts do not disrupt service delivery. We explore dual access control in this study's setting of online storage, in the sense that we build controls over both file access and download requests without sacrificing privacy or speed. In this cram, two dual authentication systems are constructed, one for every of two distinct settings. The systems' privacy and testing are also offered.

ABSTRACT

An insurance company operating as a commercial venture continues to be dealing with deception instances of various types. The sum declared by fraudulent is considerable, which may result in significant challenges; so, along with to the administration, other organisations are seeking to identify and reduce such activities. Such fraud occurred in every aspect of protection guarantee with high seriousness, for example, protection asserted towards vehicle area is deception that are frequently claimed and apparent type, which have to be possible by counterfeit mishap guarantee, as the result, we want to support a task that works on a protection guarantee informative index to identify extortion and phoney situations. The venture uses AI computations to build a model to name and characterize the guarantee. Furthermore, to focus on relative examination of The AI computations utilized in chaotic framework gathering with regards to the sensitive precision, precision, assessment, etc., . For fake exchange approval, an artificial intelligence (AI) model is built using the PySpark Python Package.

According to estimates, deception has been on increase throughout all initiatives, costing the protection area billions of dollars each year. Protection extortion is a criminal act committed with the intent of profiting financially. This is currently the most difficult issue that many insurance companies throughout the globe are dealing with. Almost all, if not every one flaw an assessment for fraudulent cases have be identified as a essential element. Protection extortion is an exploitative strategy that is frequently used for financial gain. Such deceptive cases constantly cost the security industry a large sum of money and result in billions of dollars in unnecessary costs, as result, the urge to use PC solutions to avoid extortion exercises grew, delivering clients a trustworthy and reliable environment as a result. In an addition to significantly lowering fabrication accusations.

The Publisher

ABSTRACT

This project presents a system that combines machine learning algorithms for disease prediction and hospital/doctor recommendation, with the aim of providing personalized suggestions to patients based on their health conditions and preferences. The system involves the collection of a comprehensive dataset comprising patient records, medical history, symptoms, laboratory results, and treatment outcomes. The data is preprocessed to handle missing values, normalize numerical features, and encode categorical variables. Feature selection and extraction techniques are then applied to identify the most informative features for disease prediction, considering factors such as age, gender, medical conditions, symptoms, and previous diagnoses. ML models, including logistic regression, decision trees, random forests, support vector machines (SVMs), or neural networks, are trained on the preprocessed data to predict the likelihood of specific diseases based on the patient's features. Concurrently, a recommendation system is developed to suggest suitable hospitals and doctors, taking into account factors such as the predicted disease, geographical location, specialty, patient reviews, and availability. The system is integrated into a user-friendly application or web portal to enable real-time data processing and prompt recommendations. Evaluation of the system is conducted using metrics like accuracy, precision, recall, and user feedback, with ongoing refinement to enhance its performance and relevance. This project aims to enhance healthcare outcomes by utilizing machine learning techniques to predict diseases and provide tailored recommendations, empowering patients to make informed healthcare decisions and enabling healthcare providers to deliver more efficient and personalized care.

KEYWORDS: ML; Disease Prediction; SVM (Support Vector Machine); Decision tree.

ABSTRACT

Using cardinal technologies cause the appearance of cyberbullying and Then use the network has become has become major source for it compared to mobile phones, platforms such as gaming and messaging. Cyberbullying can appear over multiples of ways. includes sexual remarks, threats, hate mails and posting false things about someone and this will seen and read by millions of people. Compared to traditional bullying, cyberbullying has a longer lasting effect on the victim which can affect them physically or emotionally or mentally or in all the forms. Number of suicides due to cyberbullying has increased in recent years and India is one among the four countries that has more number of cases in cyberbullying. Prevention of cyberbullying has become mandatory in universities and schools due to rising cases since 2015. This study uses robotic intelligence and deep learning to automatically identify cyberbullying comments techniques. Metrics such as reliability, vigilance, and memory and F1-score used To judge the model performance. It is with a precision of 95.47%, it was discovered that the deep learning technique known as the Gated Recurrent Unit performed better than all the other strategies examined in this essay.

social media usage systems, which is very common has led to an increase in incidents of cyberbullying, It could result in very serious mental effects and emotional effects on victims. The aim This project's The aim are to build Using deep learning, one may find instances of online bullying. online platforms posts using networks with long short-term memory (LSTM). The available research is directed towards mature languages and highlights a huge newly accepted resource poverty gap languages. This proposed system utilises Long-Short Cognition model (LSTM), a deep learning strategy for identifying and avoiding cyberbulling actions. The project consists of several modules, such as collecting information Plus information processing, model development, and evaluation.

Er. S. Lakshmanan
The Publisher

ABSTRACT

It is a difficult problem to rapidly and safely search sensitive data in cloud storage. The searchable encryption approach offers a safe way to save data without sacrificing its usefulness or confidentiality. Key-based security with recherche of keywords subfield of searchable encryption that has received a set of attention from researchers. However, the inside keyword supposition bother can be used to compromise the best part of classic PEKS methods. All new PEKS schemes will likely withstand the inside keyword guessing attack. IKGA mitigation has long proven ineffective and challenging, and the mainstream of current PEKS methods fall short of meeting their security objectives. We define the concept of Confidentiality with Dual-Server Public-Key Identification and Search Retrieval (DPAEKS), which safeguards against IKGA by utilizing two servers that do not communicate, and enables the authentication property, To be able to deal with the aforementioned issues. Next, we offer a DPAEKS architecture without bilinear pairings. Our system is really effective and offers great security, according to experimental results obtained using a real-world dataset, making it in practical applications.

Er. S. Lakshmanan
The Publisher

ABSTRACT

A clever health system that benefits both patients and physicians is a private medical record (PHR) system. A semi-trusted provider of cloud services often manages and stores PHRs in the cloud. Yet there is still a chance that untrusted people and semi-trusted parties might see confidential health information. A customer-centric PHR sharing architecture is suggested in this approach to preserve patient privacy and control over their PHRs. Before outsourcing, all PHRs in this system are secured with multi-authority attribute-based encryption. It enables very fine control of entry to PHRs and addresses the primary hosting issue. In order to guarantee data integrity on the cloud and protect the user's identity during authentication, a private login session between the cloud or the user is also suggested. The new online-offline attribute-based sign that the proposed authentication is based on is issued. It may increase patients' control over their PHRs by making the encrypted PHRs resistant to collusion attempts and preventing forgery throughout the sharing time.

CERTIFICATE

This is to certified that the Project Work report entitled "TO IMPROVE BEARING CAPACITY AND IMPERMEABILITY OF LOOSE SOIL" is a bonafide work carried out by

MOJEN MOHIUD DIN BHAT	IRR19CV022
RITIK DAWAR	IRR19CV028
SOHAM SHARMA	IRR19CV033
VIKRAM C	IRR19CV041

In partial fulfillment for the award of Bachelor of Engineering from RajaRajeswari College of Engineering in Civil Engineering of the Visvesvaraya Technological University, Belgaum during the year 2022-23. It is certified that all correction/suggestion indicated for internal assessment have been incorporated in the report deposited in departmental library. The project report has been approved as it satisfies the academic requirements in respect of project work prescribed for the said degree.

DEPARTMENT OF INFORMATION SCIENCE & ENGINEERING

CERTIFICATE

Certified that the mini project work entitled
"HOME COVID BED SLOT BOOKING"
carried out by

Y SRIDHAR(1RR20IS045)

The student of "Rajarajeswari College of Engineering" in partial fulfillment for the fifth semester of Bachelor of Engineering in Information Science & Engineering of the Visvesvaraya Technological University, Belagavi during the year 2022-2023. It is certified that all corrections/suggestions indicated for Internal assessment have been incorporated in the report deposited in the department library. The mini project report has been approved as it satisfies the academic requirements in respect of mini project work prescribed for the fifth semester

This is to certify that Ms. DHIRUVATARE B N (IRRI9CV011) student studying in B.E, 3rd Year, (Civil Engineering) of RajaRajeswari College of Engineering, Bangalore has completed her Internship Training Programme in Bangalore Metro Rail Corporation Ltd., (BMRCL) from 25.08.2022 to 24.09.2022 under the guidance of Mr. Shivappa D H, Executive Engineer (Phase-2B -Package-2), BMRCL.

We wish her successful career and bright future ahead.

(M. Srinivas)
Chief Engineer (PM)

HENCON ASSOCIATES.

ISO 9001:2015 CERTIFIED

DL 01-10-2022

TO WHOMSOEVER IT MAY CONCERN

This is to certify that Mr. Avan Pasha R (IRR20CV401) - student of Raja Rajeswar College of Engineering, Bangalore has done His internship in Civil Engineering at M/s Hencon Associates., Bangalore, from 22nd August 2022 to 22nd September 2022.

He has worked on a project titled "Highway Construction and Testing Methodologies for Project Management and Quality control in Civil Engineering Works."

This project was aimed to provide Project management and quality control skills. As part of the project, He was associated in the following activities:

6. Execution Planning
7. Supervision of QAP
8. Assessment of Physical and Financial Progress
9. Updation of the progress in Project Management System.
10. Appraisal of Testing Methodology for various

During the internship he demonstrated commitment to work with a self-motivated attitude to learn new things. His performance exceeded expectations.

We wish him all the best for his future endeavors.

Mr. Avan Pasha R
B.E. CIVIL ENGINEERING
Managing Director
M/s. HENCON ASSOCIATES

CERTIFICATE OF INTERNSHIP

This is to certify that particular student named Nischita L whose USN is 1RR19IS021 has completed their **Full Stack Web Development Internship** organised and handled by **Varcons Technologies Pvt Ltd** from **25th August, 2022 to 29th September, 2022**.

The person to whom this certificate is addressed to has worked on a project titled **Template- A website to sell Caffeine**. This project was aimed at creating fully-fledged functional **web template(s)** for a client of ours. As part of the project, they designed functional web pages, used databases to collect, store, and sort data, by understanding the design briefs and client specifications that were provided in the project proposal.

During the course of the internship, they demonstrated good design skills with a self-motivated attitude to learning new things. Their performance exceeded expectations and was able to complete the project successfully on time.

OFFER LETTER

INTERNSHIP OFFER LETTER

Date: 23rd August, 2022

Name: Sumukh K Musthy
USN: 18H1018041

Dear Student,

We would like to congratulate you on being selected for the **Machine Learning With Python(Research Based)** Internship position with ICSoLN, effective Start Date **23rd August, 2022**. All of us are excited about this opportunity provided to you!

This internship is viewed as being an educational opportunity for you, rather than a part-time job. As such, your internship will include training/orientation and focus primarily on learning and developing new skills and gaining a deeper understanding of concepts of **Machine Learning With Python(Research Based)** through hands-on application of the knowledge you learn while you train with the senior developers. You will be bound to follow the rules and regulations of the company during your internship duration.

Again, congratulations and we look forward to working with you!

Sincerely,

Ganesh G
 Product Manager

ICSoLN

CERTIFICATE

This is to certify that Mr/Ms. DIVYA RAGHURAM PRABHU from RAJARAJESWARI COLLEGE OF ENGINEERING bearing USN-1RR19EC016 has successfully completed internship programme at Karunadu Technologies Private Limited from 21-Aug-2022 to 21-Sep-2022 and found the candidate's performance is good.

During his/her Internship, he/she was exposed to the various activities in field of Embedded System. During the course he/she was trained and he/she carried out a project on Coal Mine Safety Monitoring And Alerting System.

During the period of his/her internship training with us he/she was found punctual, hardworking and inquisitive.

His/her association with us was very fruitful and we wish him/her all the best for his/her future.

Certificate Of Internship

This is to certify that SAMEER KULKARNI (IRR19EC067), has completed their Machine Learning With Python Internship organised and handled by IC Solutions from 23rd August, 2022 to 27th September, 2022.

The person to whom this certificate is addressed to has worked on a project titled Algorithm for predicting the risks of Chronic diseases. They designed the Machine Learning model, demonstrated and tested the working of the Model. Prepared a report highlighting its flaws by understanding the design briefs and Specifications that were provided.

During the course of the internship, they demonstrated good design skills with a self-motivated attitude to learning new things. Their performance exceeded expectations and was able to complete the project successfully on time.
