(57) Abstract :

Abstract With the fast advancement of Ehealth, there has been a surge in demand in using patients Electronic Medical Record to aid illness identification and morphological characteristics. Health records, issues, prescriptions, respiratory rate, diagnostic tests, and other occurrences are often longitudinally and appropriately portrayed as therapeutic event sequences in patient EHRs. Deep learning techniques typically take a while to training, and this can be sped up by standardizing the implicit feedback values variance that happens naturally. Regularization reduces the characteristics of the input database's variables by reducing them down to a different range, which helps to data augmentation while also boosting the back propagation algorithm process by increasing the computational efficiency. DL algorithms have been shown to be valuable owing to its high efficiency. Since predictive performance is based on the amount and quality of case sample, the major difficulty is a limited availability training and validation materials. In this research, we utilised an arrhythmia registry that contained more than heterogeneous health records in this investigation. Using all these information, we built an effective DNN for automatic arrhythmias identification.

(57) Abstract :

Abstract This study proposes an artificial intelligence of things (AIoT) system for electrocardiogram (ECG) analysis and detection of Arrhythmia (Cardiac distress). The system includes a front-end IoTbased hardware, a user interface on smart device's application (APP), a cloud database, and an AI platform for cardiac disease detection. The front-end IoT-based hardware, a wearable ECG patch that includes an analog front-end circuit and a Bluetooth module, can detect ECG signals. The APP on smart devices can not only display users' real-time ECG signals but also label unusual signals instantly and reach real-time disease detection. These ECG signals will be uploaded to the cloud database. The cloud database is used to store each user's ECG signals, which forms a big-data database for AI algorithm to detect cardiac disease. The algorithm proposed by this study is based on convolutional neural network and the average accuracy is 94.96%. The ECG dataset applied in this study is collected from patients in Tainan Hospital, Ministry of Health and Welfare. Moreover, signal verification was also performed by a cardiologist.
